These are available - I got the sources & binaries a while ago - but I can't
remember where! I still have these, and no they aren't just for 68030.
In fact it comes as a generic set of code, with a bunch of machine-specific
bits & I just took the basic PC stuff, did a tiny bit of editing of one file,
& it worked :-)
Very impressive bit of portable code there!
Thinking about it, it _was_ the official POV-Ray ftp site in the states:

' Internet

The POV-Ray files are also available over Internet by
anonymous FTP from alfred.ccs.carleton.ca (134.117.1.1). '

I would agree there isn't a huge lot of 3D stuff for the ST otherwise; most
of mine is fragments of source code nailed together, rather than glossy PRGs.

Very funny, many of them don't have a 3 bytes/pixel video mode.
among them smaller PowerMacs and "cheap" machines like the AWS 95 I
mentioned before. _That's_ what I call 24 bit colour, as three bytes are
24 bits.

J > on whats happened over the last ten years as far as makes and
J > models etc. are concerned? The last Atari I heard of was the
J > ST.

To bring you back in the loop, here are the facts - Atari recently announced that they are currently out of the personal computer business. However, they have licensed the use of TOS (their operating system) and their hardware to several third-party developers to use in their own machines.

To go through the entire history of the last few years may be a bit daunting here (there were quite a few machines released on the ST technology!). You can, however, find some Atari FAQs on the Internet. Here are some addresses via the World Wide Web to check out:

TOAD Computers (large American Atari store) - www.charm.net/~toad/

ZFC Atari page - www.nl.net/~zfc/Atari/index.html

Atari Home Page - www.fwi.uva.hl/~mdekker/atari.html.

I will say this - being an ST or any Atari owner certainly is not boring, to say the least - there have been some wonderful products released for the ST line throughout its life. I mainly use mine for MIDI, telecommunications, DTP design for work, some graphics manipulation and viewing. And, despite the occasional flame war in this area (mostly from ex-Atarians who feel the compunction to evangelize us, the "great unwashed", to cease our delusional attraction to our efficient machines and join them on the "dark side"), the average Atarian is pretty quick to help each other out and is generally friendly.

If you're using a PC to access this, you can still experience the joy of using an Atari! There's at least two emulator boards out there that will replicate an ST on your platform so you can at least utilize productivity and graphics software. There's even now a software 8-bit emulator, PCXformer, that will allow you to relive your 800 XL days.

Welcome back - you've been gone ten years too long! :)

Wrong. If I'm not mistaken, HCP.TTP, which is used to convert ASCII format
to ST-Guide format, will also perform the operation in reverse if you drag a
HYP file to it.

On 03 Aug 95, maberg shot this through the ether to All ...

m> CPU: 68060 @ 50 MHz
m> 8 MB (max 128) RAM
m> Video: TOM, 64-bit RISC, 2 MB DRAM, 27 MIPS (from Jaguar)
m> DSP: Jerry, 64-bit RISC (from Jaguar)

------------------------------ cut ----------------------------

m> The Magazine-publisher is Atari-distributor for the Netherlands, so I
m> guess this article does have a bit more to it than just a rumour.
m> All specs are taken from the article and reprinted without mistakes.
m> (or permission ;-))
m>
m> I just wonder what you all have to say about this.

It sounds to good to be true. I've been informed that this article (with minor changes) was lifted from one which appeared in the French "Atari Magazine" several months ago. The specs are, of course, marvellous. The big question is what this machine will cost if it ever actually appears. If it palces itself in the same price class as the Commodore A4000 machines, for example, it won't be anything that will be accessible to the mainstream of Atari users.

The other point that bothers me about the report is that Atari Corps clearly stated a couple of months ago that ALL development on the computer side of the business had been scrapped. I realise that Atari have a tendency to either say too much or nothing at all, but it's unlike them to totally deny the existence of any development if they had something like this in the works. I would have expected something more on the order of "we're working on something but we don't want to release any details at this time".

OTOH, there WAS a rumour among Atari developers about a Power Atari type of machine being developed for release at the end of next year. The machine was to include RISC based (Jaguar) technology and this would seem to be confirmed by the specs you've presented here. Then again there are still rumours concerning a Jaguar version with keyboard and HD faciclities. I suspect that we won't know the truth until a new machine is suddenly presented at some show. I, for one, am not holding my breath. The latest news I've heard is that Atari have started up the Falcon production lines again due to sufficient orders having been placed. This is, in a way, good news, but it's also somewhat of a stab in the back for C-Lab, whose contract, AFAIK, forbids them to produce low price Falcon clones as long as Atari themselves have stocks of standard Falcons.

ATB,
Tom

1868. Has anyone registered Rainbow [falcon]??

DS> falcon, and I was wondering who I should approach, and what the cost
DS> would be in Canadian dollars (U.S. is okay, I can convert between the
DS> two).

If you're refering to the art program Rainbow2 there is, to my knowledge, no established North Ameraican distributor. Toad Computers in the US would be the most likely ones to have it. The program isn't, as you seem to believe, shareware but, rather, a fully commercial product. Theoretically, you should contact:

Adiction Software
Box 5012
S-451 05 UDDEVALLA
Sweden

as they've retained the distribution rights with the exception of the UK, France and Sweden itself (I'm the Swedish distributor). Mandus and Rasmus (the programmers can be E-mailed on:

addict@tripnet.se

Hope this provides the help required.

CG> The bombs are the usual way for the Atari to say goodbye -- like GPF
CG> on a pc, guru numbers on an Amiga, etc.. The number of bombs may be
CG> significant.

Not quite right, actually. The bombs are the system's way of telling the user that there has been a major system error. It's usually, but not always, "fatal" and demands a machine reset. There is no damage to the machine, however. The number of bombs which appear denote which particular error has occured and can run anywhere from 2- (I think) 14 bombs.

m> with a 64-bit RISC processor? It's at _least_ 2 generations difference
m> between the two. (remember the Jaguar is, to this date, the *fastest*
m> game machine in the world...)

I think that you should pay attention to Claus' statements here. He's recognised (or, at least was, his name hasn't come to my attention in the last couple of years) as one of the leading authorities on Atari hardware, especially in the realm of hard drives.

As for his comment about Falcon 040, he's perfectly correct. I have personal confirmation from a source fairly high up in the Atari hierarchy that there are, in fact, a couple of prototypes of the Falcon 040 in existence but that "they're probably being used as doorstops in Sunnyvale" and that there were, at the time, no plans for the model to be released on the open market.

I, too, would be among the happiest of people to see the machine described in ST Nieuws were to actually appear. I'll believe it when I see it.

On 03 Aug 95, II shot this through the ether to All ...

I> How dare you compare me to a software pirate you fucking
I> scumbag.

Err, we don't usually use that kind of language in here. Yes, I do use those terms in private but some people do react very negatively to profanity.

I> *I* am interested in keeping the atari alive. and that involves
I> getting new software, be it commercial or shareware. if there
I> is no new software, i believe that sharing of older, unavailable
I> pieces of software is a good idea if our beloved ataris are
I> to survive.

The point is that there IS a greta deal of new software, both commercial and shareware, appearing at the moment and the fact that you, personally haven't been able to find a supplier doesn't make it right for you to spread unauthorised copies of the softwarel. I understand your point where it concerns software where the original author or distributor simply isn't there any more, but this would tend to concern older software which doesn't usually meet modern standards. Further, the fact that, for example, Microprose no longer supports the Atari platform (other than the Jaguar) doesn't mean that they have released the software into the puclic domain. You could get into a heap of trouble if somebody decides to make an issue of it. You don't have to crack a piece of software yourself to get indicted as a software pirate. I'm not trying to start or continue an argument with you on this point, so please don't send me an abusive message in reply. That would be childish.

I, myself, am a distributor of both commercial programs and software and I can tell you that the type of distribution which you seem to be advocating would hurt our business and lead to exactly the situation which you seem to deplore. We want to keep supporting the Atari platform, but this means that we need the support of the user base, as well. It's all symbiotic.

I must admit that I'm surprised that you claim not to be able find new software. Your address informs me that you're located in Ireland and, although I'm unaware of the existence of any Atari retailers in Eire itself, there are a number of very active retailers and distributors in the UK. Try buying a copy of ST Format or subscribing to Atari World (whose publisher is, himself, Irish) and you'll find adverts from a number of commercial retailers as well as various PD'Shareware firms which are very much alive and kicking.

I> the internet is about freedom of expression. the atari newgroup
I> is about people who like atari machines sharing a common interest.
I> to that end, your hostility is misplaced...

I don't seem to remember the person who sent you the original message as opposing your right to express yourself but simply pointing out the possibly illegal and potentially harmful effects of your suggestion.

Try either the incoming dir of ftp.dungeon.com or the pub/atari dir for the
wonderful Apex viewers APEXFV3.ZIP. I've just uploaded them.

My guess (knowing Atari) is that by the time the MicroBox is
relesed, PC and Mac users will have moved on to proccessors of
such speed & power, to be unimagainable today. The MicroBox will
be small potatoes...

Whats more why not just render on the fastest machine you can lay your
hands on (which certainly won't be an Amiga), then display the output
using the bast graphic output you have - which of course can be on another
machine. Shouldn't be any problem moving the stuff over with a network or
a decent optical disk.

:-)

Hello - has anyone heard or tried a program by Compo called Componium?
According to the ad in Toad's catalogue it looks like a very decent
sample tracker, but the ad doesn't mention if it supports playback via
any sample carts. If it does I'll probably buy it!

1887. Configuring TAF package for SLIP?

Newsgroup: comp.sys.atari.st
Date: 1995-08-07 00:00:00 UTC
From: sxp17@po.CWRU.Edu
Message-ID: <4049pd$inv@usenet.INS.CWRU.Edu>
Source record: 161115

Hi - I have gotten the TAF package (sincere cudos to everyone involved!) to work on my Falcon 4/210e (TOS 4.04/Supra v.32) - sort of. I have three main problems: 1) I must manually use dip to login to my university SLIP line (see below) 2) Chimera will not work when connected (can't locate dip) and 3) I can't 'get' any files, as my FTP connection often locks up, and I get booted for timeout delays (even when not getting). (I set the site to transmit binary and lcd:J).

This is what I have been doing to log on (In case anyone cares!) . . .

```
J:home/ dip -t
DIP> port /dev/modem2
DIP> dial 754-7547
DIP> term
```

(from here, I logon and connect, then return to dip via ^])

```
DIP> get $local _my_ip_address
DIP> get $remote 129.22.120.5
DIP> get $mtu 1500
DIP> default
DIP> mode CSLIP
```

(Now I can FTP, sort of . . .)

My university provides no PPP connections, and this type of networking on my Falcon would be a dream come true . . . so any and all help will be appreciated!

Thanx!

maberg (maberg@xs4all.nl) wrote:
: I heard about the same price for a basic system (4 MB RAM, no HD, but
: with CD-ROM drive) as a comparable MAC or clone.

What's "comparable"?

: >: Case: Towercase designed by Apple craftsmen

: >"Apple craftsmen"... sounds fishy to me...
: Sorry, "craftsmen" were *my* words.

What I thought was sounding fishy is that they should use a case
made or designed by Apple. Well, if it's just a prototype, it makes
some sense, but you wouldn't try to sell a Atari box in an Apple
case if you were Atari, right?

: 3) All announced atari hardware *did* hit the market, think about the
: ATW 800, TT 030, Falcon 030, Jaguar, ST-Book, CD-Rom, Portfolio...
: The *only* exeption is the TT/X wich was not a new machine but a TT in
: a new case. It was cancelled due to economic, not technical, reasons.

Interesting. I never heard about a TT/X project - any details?

: 4) The main hardware is already there, no additional cost in designing
: custom-IC's. (Jerry from Jaguar, Tom from Jaguar)

The main hardware is always there... glueing together the system
and balancing is where a lot of design time is spent.

: 5) The towercase with (apple?) look really exists: the magazine has a
: photo of it printed in the article. (and it is *not* a cheap pc-tower
: with a paintjob done...;-))

So they might have access to a prototype.

: 7) Atari *did* make some money selling the Jaguar, and from the licence
: of the jag technology to a PC-card developer (name escapes me now,
: wasn't it insignia or sigma or something like that?).
: And didn't Atari say that they competely focused on the Jag just to
: make some cash and thus be able to come back with a new computer ?
: That was exactly what they gave as a reason for retiring from the
: computermarket IIRC.

That's what they said back when, and they even might have believed it
for some time. Right now, they're in a struggle with gaming industry
giants.

: Let's all just hope for a miracle... This platform really deserves it.

Any platform other than those dang clones deserves some success, really.

>> ftp, etc.

> I've heard of MintNet, but never used it. Does it still allow use
>of the desktop and how much RAM and hard disk space are required to run it?

Yes. Both MiNT and MiNTnet are simply extensions to the operating
system. People often get confused between MiNT and a
MiNT/MiNTnet/MiNTOS/X etc Un*x like system, which is more
complicated. To use MiNTnet with GEM is not too difficult, though
there is only one GEM-based client for it at the moment. It will allow
you to mount another machine's hard disk to a local directory and if
that's all you want then it should work fine. As to how much RAM and
hard disk space it takes the straight answer is - I'm not sure! I'm
sure someone will correct me on this estimate but, about 500K RAM?
Possibly? I am fairly sure you won't need a Minix partition on your
harddisk and if I'm right that will make things easier. Once again at
a guess I'd say you'd need about a meg of hard disk space for MiNT,
MiNTnet and NFS.
Anyone care to correct me?

RE: Invision Elite:

>Does anyone know if a proper version ever saw the light of day? Does the
>company still exsist?

Power Thought, as near as I know, no longer exists. However, the program has apparently been bought and upgraded by DMC Publishing and is now up to version 2.0, much enhanced over the demo you've seen.

While the interface is essentially the same, some tools have been regrouped and enhanced, the program now works in color (number of colors dependent on current video mode up to 256 colors) and handles a few more file types. I've found it to be a pretty good program overall and FAR more reliable than Prism Paint 2.

It should be available for just over $100 well-invested dollars from Toad Computers. Some copies of versions 1.x are still floating around; make sure you specify you want version 2.0 unless you want to be stuck in monochrome! :)

Simon, I have done the same with VideoMaster Falcon. Digitizing,
frame by frame off a VCR then converting the TPI format to TGA
and loading to ApexMedia. It would be nice if Apex supported loading
numbered files, as you mentioned, easing the task. I was told by
Lexicor that in the Pro package there is a utility to convert a
string of GIF's to the FLI format.Was this included with your
package? I do have a PC utility that does the same if you number
your GIF's in order. I am interested in user opinions concerning
Expose, it you know of any.

Don't tempt me to count each color :] :]

While I have recieved mail about the "alpha channel bit", which I have
heard of before but not since the days of the MacII, I think that was a
quirk of the older video cards (like the 8*24 and the HRVC). The reason
I say this is that I can't find any mention of the "alpha channel bit"
in any of the Macintosh technical documentation. This includes Desgining
Cards and Drivers for the Macintosh Family 3rd Ed, Imaging w/ Quickdraw
and Advanced Imaging. This is the stuff people use to design freakin' video
cards and write imaging programs. If it's not in there, it's going to be
mighty obscure. I will check more sources but I still can't find any
mention of it.

> My sources are several issues of "ST
> Computer" (who advocate Mac/MagiCMac), excerpts from the MacFAQ from
> Mausnet, etc..

The problem is, where are these sources getting their info? We're talking
about tertiary to quarnary (?) sources of information here.

If the 16th bit is not used for color, then it's used for something else.
If it's used for something else, then it's mighty obscure but most likely,
quite useful. My question is, if it's useful, where's the docs?

The 16th bit would definately, not just be "tossed out". Hardware designers,
no matter how stupid they may be, would not go out of their way to get out
of a power of 2. It's just too much of a pain. The 16th bit is used for
something.

> I will get it and post it here.

Please do. I'd like to see this information and compare it with other sources.

1899. Internal IDE/SCSI in a Falcon?

Newsgroup: comp.sys.atari.st
Date: 1995-08-07 00:00:00 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <404tsm$g12@lyra.csx.cam.ac.uk>
Source record: 161127
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

How do you connect an internal SCSI disk to a Falcon? As far as I can tell the only SCSI connector is the external one. Is there an internal one as well?

I am trying to fit a SCSI disk inside my Falcon as well as the internal IDE disk. Is this possible? What happens to all the connectors on the back of the board if you put it in a desktop case? I thought the idea was to put everything inside the case.

Physical space inside the falcon isn't a problem, it's just the connector. Also, is all that shielding *really* necessary? :)

Thanks,
Phil

Yup, the i/o server is a modified 1MB MegaST (with a SCSI
driver chip called Morpheus) and the other board is indeed
the video (based on a chip called Blossom). Helios was
indeed the OS supplied wih the machine.

> Basically, I'm looking for any information about this
> machine; in particular, I'd be very grateful for
> pointers to any companies that might still be able
> to supply documentation for the machine and its
> software.

Perihelion still support Helios, but not the ATW bits of
it (the iserver and video driver, mainly). They publish
a book called _The Heios Parallel Operating System_ which
describes Helios in general, but doesn't help much with
the ATW aspects.

In sum I don't think you'll get documentation from any
company; however I have some provisional stuff from the
developer's kit which I could probably copy for you without
getting into too much trouble from either Atari or Perihelion
-- get in touch with me by email if you want to discuss this
further.

As far as the monitor and mouse are concerned, you're looking
for an Atari SM124 or SM144 and a standard Atari mouse (or
compatible).

Best wishes

Chris

Ok, after a few requests regarding my posting my homegrown documentation
on MiNT, MiNTnet and other stuff, you can find it at:

http://www.gti.net/azog/mint-docs.txt

it's somewhat a large and rambling file... turned out that after I cleaned
it up so that others can make sense of it, I made more and more changes.
I still need to add GCC, MintOS and X to it, but it covers the basics
of MiNT, some of the more nessassary utilties like shells, and MiNTnet.

Any suggestions are welcome...

Hello Larry
Phil admits that v1.10 and 1.12 were a bit buggy (!) He can say that
again.
Version 1.20 has been a rewrite job. The bugs you mentioned I also
found in 1.12 have now sorted out and the general "feel" of the
program has been improved no end. Speed of access of mail/news has
been increased by changing the file format and the language the
programs are written in. It now runs under multi tasking opsys such as
MagiC but the online bit does not (yet). This is the bit Phil is
working on now (or soon)
Right then lets put things into perspective.
I am quite happy to let my wife and 2 sons loose on the Atari using
Oasis 1.20 (no offence to any ladies reading this). What more can I
say!

When I was using NOS I wouldn't let them within 20 metres of it. Lets
face it NOS is a pile of nasty, brown smelly stuff

Nope. Atari never made that statement, AFAIK. Users have surmised that -IF- Atari made lots of money with the Jag they might come back into the personal computer market in a big way. But given the market today and the relatively lackluster success of the Jag, I really doubt this would happen.

But time will tell, eh?

1912. Atari ST Hardware for Sale

Newsgroup: comp.sys.atari.st
Date: 1995-08-07 00:00:00 UTC
From: klassa@aur.alcatel.com
Message-ID: <405g5s$or4@aurns1.aur.alcatel.com>
Source record: 161140
Cross-posted to: triangle.forsale,comp.sys.atari.st

I've got the following for sale (or local trade; see below). Everything
is in good, working order (except where noted).

o Atari 1040ST (1MB RAM, TOS 1.4), internal floppy, mouse $150
o Atari Color Monitor (no burn-in) $100
o Atari Mono Monitor (no burn-in; *) .... $ 75
o Supra 20MB Hard Drive (case, power supply) .... $ 50

(*) The mono monitor gets a little flaked-out when it gets overly warm.
Tweaking one of the pots always fixes it, but I wanted to mention this
"feature" in advance.

If you don't like my prices, please make a counter-offer... I'm
especially open to offers on the whole system.

I've had a couple of deals fall through due to either miscommunication
or bad timing... So that I'm totally up-front, here's how I'd like to
do this:

o Local sale... We meet at my place, I demonstrate that
everything works :-), we agree on a price, you give me cash,
you take the equipment home.

o Non-local sale... We exchange email, we agree on a price,
I ship COD. *Buyer pays shipping*.

If you're local to me (Raleigh, NC area), I'm open to trading for
working, in-good-shape PC "stuff" (at the moment, I'm looking for
72-pin, *parity* SIMMs and hard drives [IDE or SCSI]). We'd have to
verify that your stuff works in my system before we finalize the deal.

Again, make counter-offers if you don't like my prices.

Thanks-
John

Source record: 161143
Cross-posted to: demon.ip.support.atari,comp.sys.atari.st

Your help would be appreciated....

I'm running a Falcon030(4/85) with a SupraFax V32bis Fax Modem and
want to get the best data transfer speed when connected to the Net using
Demon's AtariNOS Internet Software - after all, when paying for a 'phone line,
you need to keep time on-line short!

I've come across HSModem6 and have installed the DRIVIN.PRG and
SCC.PRG (without changes) in the AUTO folder with DRIVIN running before SCC.

I've also ammended the 'attach asy' line in STARTUP.NOS to SER2:
instead of AUX: and have set the baud rate to '134'. In the dial string I
have also set the modem return codes to display full connect, compression
protocol and carrier.

Now - and this is where I might well be misunderstanding things - the
Supra V32bis modem is capable of 57,600 bps throughput (approx 5000 cps ?) and
one of its Result Codes is CONNECT 57600.

When I run the NOS software and key 'A' to log-on I get a brief line
saying 'unknown asy rs232 speed(134)' (or something like that) and then the
log-on carries on. I get the folllowing on screen

CARRIER 14400
COMPRESSION V.42BIS
PROTOCOL: LAP-M
CONNECT 19200

The cps rates appear to increase from about 1100-1200 up to 1400-1500,
but not to what I was quite expecting! I thought the CONNECT would show 57600
and everything would be a lot faster...

So please - am I doing something wrong: the 'unknown speed' line
worries me!

Many thanks in advance - e-mail or response in the newsgroups would be
gratefully received.

OK, I've checked the comp.sys.mac.hardware.video and found the 32k reference
and somebody has also pointed out a technical source in the old Inside the
Mac series.

I'm glad this is resolved, even if it's not in my favor. However, what
disturbs me the most is that the information was so hard to find from a
technical stand point.

INVISION ELITE is now at version 2.0 (color).
It is commercial software and sold by (here in North America),
DMC - distributors for Calamus SL.

Contact Nathan Potechin at potechin@genie,geis.com for current pricing.

Pekka,

I know you sent that with the best of intentions but would you consider
sending it by EMail rather than blasting 40k UUE'd messages in a non-binary
group like this next time please?

If you think others may be interested, you could always put a short reply
in here to confirm that it's available by UUE'd EMail.

The programs were DRIVN.PRG and MFP.PRG which were run from my
auto folder. I'm sure the programs work perfectly but I am still
running at 2400 baud and don't really need the routines.

Falcons still sell for over $1500 USD for a HD equipped system???

Sheesh!!!! Its criminal!

When I had a bird it cost that - now its almost 2 yrs later...

I'm planning to invest in a new computer in a couple of months and
plan to sell out $1700. You can bet for my hard-earned-money I'm gonna
get a FAST, FULLY LOADED machine that can run lots of software.

Will it be a Falcon? Hell no, not for that money... will it be a Mac?
Maybe, but doubtful... Will it be a brain-dead PC? You bet!

For that kind of money I can have a nice P-90, CD quality sound, and a
GIG HD!

Flame me if you wish - I spent 7+ yrs as a die-hard ST user (and developer).
But, the prices are way too high for old technology.

Ari

POV is provided with source, if you get a proper distribution, so
you can compile for 60000/20/30/40 with/without FPU, whatever.

I used to use the 030/FPU version, now that I have an LC040, I just recompiled
without FPU support.

Hey - The CDAR was a great unit for its time. I bought one from Atari Oz
for A$60. Funny thing though - it made this horrible loud buzzing noise
from the audio out. The reason... when I opened it, on a big label it
said "DO NOT EATH THIS APPLIANCE", and what had they gone and done?
they earthed it! - making it totally useless! Simple solution though, one
snipped wire and it worked fine. I like the fact that it had an IR remote
and controls for playing audio CDs as well. Used it for a long time until
I sold my STe and got a Falcon...

Aha, that explains it. I didn't realize you were talking about an
imaginary computer that never made it ;-). I suppose it's the same
machine indeed, but with a few modifications to keep it up to date.

Besides, I followed the entire thread resulting from your "open letter"
to John Townsend but have missed that letter starting it. Could you send
it to me via private Email please ? I would be much obliged...

>is available in Native form for a RISC CPU.

That is true, but it doesn't automatically make the 68060 a *bad* chip.
It does compare good to a Pentium, that should be enough for now (?).
The 68060 is (internally) almost a true RISC processor BTW !
Apple did not choose for the PPC for speed reasons (the 68060 _is_ just as
fast as emulated code on a PPC 604) but because the PPC processors have
a better future than the 680x0 series (there will never be a 68070).
But the RISC processors _are_ better, no argument about that though...
Still I think most of us _would_ have a Medusa T60 (and be *very* happy
with it, too) instead of our ST's if only the Medusa's price was $1500.

According to the comp.sys.68k FAQ : (talking about MC68060 processor):

"It has a list price of $US 308 probably at quantity. (unverified)"
Although "unverified", this should be considered a fair estimate...

>On the other hand, why should Atari publish a new machine, when they

>2) cancelled all treaties with Atari dealers. How are they going to
>distribute the machines?
>3) I willnot talk about the marketing here, alll whathas to be said, has
>been said in the past

That could prove to be _very_ difficult indeed. But when the falcon was
introduced, the dealernet (at least in europe) got bigger again, after a
real bad period. Same goes for the software-developers, especially the
shareware-programmers. The same could happen when a new revolutionary
computer is marketed. (marketed...? by Atari...? Naaahh ! >;->)
You never know.
But every week that goes by makes it more and more improbable...

>BTW, In Austria we had the official introduction of the SONY playstation,
>announced even on TV and on Teletext (Videotext IMO it's called in some
>countries).
>Still no Jaguar around.

Well that's very stupid from Atari and very unfortunate too...
However it only shows Atari's bad economic insights (as reason 1), and the
fact that SONY is such a _huge_ multinational with so many resources and
power that the _only_ company with the power to win from SONY is probably
Microstuffed (as reason 2).
I mean, _if_ Atari's marketing would be any good, would they _then_ be
able to take on giants as SONY with any chance of succes ? I think not.

Which brings me to another point:
If the entire worldwide community (and the US-government, IBM, Apple, etc.)
does not stand up soon to Microstuffed and Bill (his first name says it all,
doesn't it ;-)) G*tes, and their increasingly agressive marketing-politics,
no computer company, bar none, will have _any_ chance of releasing _any_
future new 'different' computers at all. I myself am very happy paying much
more for a computer, if I thus preventing to get microstuffed-dependent.
Providing it does what I need of it, that is. And if it's harder for me to
turn it off than it is to turn it on that's just fine by me ;-)

This Morpheus chip is located at address $FF0000 in the memory of the ST. It
controls the SCSI interface (I think it's SCSI-1), and the diagnostic bus. Via
the diagnostic bus transputers can be reset etc.
The TOS version is 1.2 but you can upgrade to 1.4 by just replacing the ROM's.

>-- get in touch with me by email if you want to discuss this
>further.

Atari Benelux said they didn't support the ATW anymore. I could not even get
any docs. Perihelion can still sell the Helios software for about 800 pounds
sterling. Just a little to expensive for me (for a completely unsupported
system). However, I am porting the INMOS standard iserver so I can use
the T800's (still in pre-alpha state:-)
But I've still got a few problems: can't get the T800 on the motherbord
running (farmcard Ok), and the system crashes if I try to read anything from a
Quantum LP105S SCSI disc. So I'm using a Megafile 30 disc on the DMA port and
the first processor of the Farmcard as my root processor.

>As far as the monitor and mouse are concerned, you're looking
>for an Atari SM124 or SM144 and a standard Atari mouse (or

All the unix systems I have used have this already - if yours doesn't,
complain.

I've successfully done it with MS-DOS formatted double density disks (720k).
All you need to know is:

mdir a:
mcopy unixfile a:\file
mcopy a:\file unixfile

Thats it. Just msdos commands with an 'm' at the start.

.

I know you meant well, Pekka, but...

Please do NOT post binaries to comp.sys.atari.st! Much better to send it to the .binaries newsgroup and then put a post here letting people know where they can find it -IF- they are interested.

People need to understand that some folks have to pay for their net access and that some newsreaders do not allow you to skip over unwanted articles. If they don't care for your long binary file, you just cost them money, time and aggravation.

So please try to be considerate of others, OK? NetRules DO have a purpose.

Thanks,

-Hutch-

1939. 4 sale...

Newsgroup: comp.sys.atari.st

Well, I have a few Atari ST-related items for sale, if anyone is
interested:

-MegaSTe/4
-1040STf (2.5 megs)
-Megafile 30/Supra30 hard disk combo
-Spectre GCR (3.0) with ROMs
-Mouse Master
-misc old ('86-'89) games

If anyone is interested in any of these items, send me some
email at:

Robert.Anisko@daytonoh.attgis.com

Thanks...

Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

Hello to all,
I've got a few questions that I would like some help with please post
back to the group or e-mail me if you can help.

(TOS 1.2 -> 1.4)
Mother has an old 1040STfm with TOS 1.2 can this easily be upgraded to
1.4? (No we don't want TOS 2.06!)

(Hard Drive Q1)
Should mothers ST be able to read my Hard drive?
My drive is running on an STE, and uses SDManager driver.

(Hard Drive Q2)
I want to use an alternative driver, got any suggestions.
SDManager lets me boot from floppy by just pressing 'A' on boot-up
the driver must have a similar, as easy feature.
The Drive is 1Gig, and I don't want too many partitions, one larger than
200Meg would be nice, SDManager doesn't seem to like any much bigger
than this.

(Oasis)
This is the thing I need most help with.
I've been having problems with it from the start but I like the package
and have only heard encouraging things from everyone who has got it to
work... So I wanna be able to do the same!
So I need to eliminate which part of my set-up doesn't like Oasis.
So if you have used Oasis, and it's behaved badly let me know what
config you are using, Computer, TOS, Hard Driver, Memory, and anything
else you think important. Let me also know if you wanna here the results
I will of course tell the programmers when I figure it out, maybe it
will help them out for the next version.
Just for the record my config is:-
STE TOS 1.62 4Meg Memory, SDManager Driver.
(I get //// and ????? instead of text with Oasis)

Sorry this post is a bit long but I wanna sort this lot out so if you can be
helpful I would be most greatful.

Ade.

Just one point to add here: the Atari desktop's got many features of
Windows '95.

In fact, one of the largest newspapers in Germany, the Sï¿½ddeutsche
Zeitung, had mentionings of Atari in two articles on Windows'95.

The ST Book is available here in Germany, but true, it is a rare beast.
The CDAR 504 flopped (it was out too early), but I personally had a fellow
student at my university who owned one.

The ST Pad was never released, but it existed. Who'd have bought it, BTW?
Remember Shivji's "Momenta" flop or Apple's Newton?

and bits on QRT as well.......

Anyway, I got a copy of POV 2 from a web site somewhere in France I
believe, and I use that on a plain vanilla STE with 4Mb RAM. I found it
when I was trecking through all the Atari related sites I could find.

I'll see if there's a reference to the location when I get home (& if I
remember - I've got a lot to think about at the moment)

Message-ID: <53_graham@grasper.demon.co.uk>
Source record: 161004

It was none other than Landstrider who did write on 08 Aug 95 that ....
L> I have the VidiST 12 and somtimes use it although I have now
>> : got an Expose Board the VIDI does some things maybe even better than
L> that !
L> Stop the press! I have credit card in hand ready to purchase
L> Expose. Are you saying that it is an inferior product compaired
L> to Vidi-ST? I use VideoMaster Falcon, and while single frame

Nonono ! Most certainly not ! EXPOSE is a much better product all round but there is just one area that VIDI ST is 'capable' and that is grabbing screens at higher resolutions (768*576*TC) more easily , the fact that it is much harder work to get anything of quality out of it cannot be under stressed though since it does not have the on board RAM for example so you need much more expensive and better spec'd video equipment. As for Capturing anything other than ROCK solid Freezed frame SVHS Vidi 12 is quite frustrating sometimes and not capable all of grabbing realtime video at all. The two products are simple not in the same league at all.
L> capture is not bad from a camera, I would hope Expose is many
L> times better. What is the quality of the video stream captured?
L> Is it better quality than MPEG?

Videomaster I have not used but I can safely say I think (and based on conversation with someone who had VM and now has EXPOSE) that it is not in the same league either in terms of Capturing video animation and/or still image .

Even they've done it. I recall an apparent joint venture between Sinclair Research, Psion and some other company who were working on the successor to the Quantum Leap; I believe they got as far as the preliminary stages, and then Sinclair generally dropped their computer line. But they had announced it, if only briefly and to a small(ish) audience. I can't remember its name; I'll have to re-read the Sinclair FAQ again.

1960. Shielding in a Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-08-09 00:00:00 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <40afdk$rp3@lyra.csx.cam.ac.uk>
Source record: 161008
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Is the shielding *really* necessary inside a falcon?
(by shielding I mean the metal sheets screwed on to cover up the board)
What is likely to happen if I take some or all of it out?

I need some more room, and that is the obvious thing to remove.

Thanks for any help,
Phil

Phillip Davey (Path) (pd@mole.bio.cam.ac.uk) wrote:
: How do you connect an internal SCSI disk to a Falcon? As far as I can
: tell the only SCSI connector is the external one. Is there an internal
: one as well?

Nope.

: I am trying to fit a SCSI disk inside my Falcon as well as the internal
: IDE disk. Is this possible? What happens to all the connectors on the
: back of the board if you put it in a desktop case? I thought the idea was
: to put everything inside the case.

Put it in a tower case and you'll be able to run a line directly from the
SCSI-II connector to the drive internally in the tower case. Impossible
with the existing Falcon case.

: Physical space inside the falcon isn't a problem, it's just the connector.
: Also, is all that shielding *really* necessary? :)

The shielding not only keeps your neighbors from running you out of town,
because you'd ruin their TV reception; it also prevents your Falcon from
being interfered with by external radio sources (CB's, HAMs, Cellular
phones, etc.). Besides, with the limited space you destroy the small
amount of air space that the puny little fan needs to cool. Things are
already running pretty warm as it is.

I am using Cubase Audio Falcon with a 1gig HD and mono monitor and would not
mind testing the program if it is relevant to my work in some way which sounds
highly likely!

1965. Incredible Package Deals!!

Newsgroup: comp.sys.atari.st
Date: 1995-08-09 00:00:00 UTC
From: eifert@ix.netcom.com
Message-ID: <40adh0$b8b@ixnews7.ix.netcom.com>
Source record: 161013

****** INCREDIBLE PACKAGE DEALS ********
(Please pass this on to your Atari user group -- Thanks!)

The J. V. Fletcher Library in Westford, MA is reluctantly selling the following Atari packages for the best offer. We have used and maintained these machines for the past few years, and even offered the main Mega 4 system for public use (very popular). For a while there I was probably the only person in America to use an IBM at home (DTP side business) and an Atari at work. But time marches on, and we have had to convert to IBM contemptibles in order to standardize with the rest of the town. The following systems are being offered AS A UNIT -- they are packaged and ready to mail along with *most* of the documentation (*all* the software comes with original box and manuals, some of the hardware may be missing a manual). If a package has more than you want, make an offer and sell the excess to your friends <grin>.

IMPORTANT NOTE: These systems will be shipped C.O.D., with the shipping charges ADDED to the purchase amount. When the lucky winner picks up his (or her) system, be prepared to pay the agreed price PLUS C.O.D. and shipping charges (probably $20 - $30). Once I have accepted an offer, I'll e-mail with the total charges. Those living near Eastern Massachusetts can save C.O.D. charges by picking up their systems personally at the library.

*** Don't be shy folks!!***
Every offer will be considered!! Just remember that other avid Atarians will also be bidding <grin>

OK, on to the great deals:
(NOTE: Anyone buying System 1 gets a FREE 1040STf w/1 meg RAM -- works great, useful for spare parts)

---------- System 1 ----------
Hardware:
25 Mhz Atari Mega 2 upgraded to 4 megs RAM
Megafile 30 hard drive
Atari SM124 Mono monitor
Migraph hand scanner with Touchup and Migraph OCR
Software:
Convector / Arabesque
Calamus 1.0 / Outline Art

That's Write
LDW Power
Superbase
XBoot
Diamond Edge hard drive utilities
Image CAT
GEMvelope

```
-------------- System 2 --------------
Hardware:
Atari 1040STe with 2 megs RAM
Impulse 40MB hard drive (Supra host)
SM 124 Mono monitor
Software:
Atari Works with scaleable font GDOS
GFA Draft
-------------------------------------------------

-------------- System 3 --------------
Hardware:
Atari 1040STe with 2 megs RAM
Impulse 32MB hard drive (Supra host)
SM 124 Mono monitor
Software:
Calligrapher 3 Gold with Garamond Font disk.
ST Master CAD
-------------------------------------------------

-------------- System 4 --------------
Hardware:
Atari 1040STe with 2 megs RAM
Atari SH 204 20M hard drive
Emerson color / mono monitor with Omniswitch and cables
Software:
Word Perfect 4.1
Microsoft Write
Deluxe Paint
Cyber Studio CAD 3D 2.0
TCB Tracker (music program)
-------------------------------------------------
```

---------- System 5 ----------
Hardware:
1040STe with 1 Meg RAM
Atari SC 1224 color monitor (the nice one)
External DSDD disk drive
Software:
Mavis Beacon Teaches Typing
Curse of the Azure Bonds
Populous

Populous II
Secret of Monkey Island
Battle Chess
Sim City
Loom
Lemmings
Oh No! More Lemmings
Imperium
Colonel's Bequest (Sierra)

> way of getting BlowBoot to work within Mint.

I didn't want a big text-only MiNT system - I just want it the way it
was _before_ MultiTOS. I had one GEM-program running, and used TOSWIN
to have one or more text shells in windows. That worked great. It
was fast enough. I experimented with STARTER.PRG, but I didn't get
it to work yet. I'll try some more.
If I just comment out the GEM= line, I get a BlownUP (:-) screen, but
with the `mouse droppings'. Strange enough, setting it to GEM.PRG
doesn't make any difference.

Note: Under MultiTOS things work fine, but with the AES 4.1 kernel I
also get the `mouse droppings' sometimes. It's not relaxing to work
in the lower part of the screen when the system can freeze up any
time...

> atari stuff could be created.

Since then, there appears to have been an increase in for-sale posts to these forums.

A group comp.sys.atari.forsale would be an advantage in that people wishing to sell/trade/buy Atari equipment or peripherals would have a forum dedicated to this. Amiga users have one called (I believe) .marketplace, and the absence of a similar area here is surprising.

So, let us have a discussion as to whether such a group would be worthwhile and get a reasonable amount of traffic through it.

> This information is not 100% sure, but lets hope, that they will really
> release new TOS-versions.

Hopefully it will be available for older hardware than Falcons - such as
my TT.

Also hope that it wont be a "Music-TOS" with only music-oriented
improvements done to it.

Atari users, whether their lives revolve around Direct-To-Disc recording
or not, would, from previous postings about TOS 4.92, gain a lot from this
being released.

The sensible moves that C-Lab have made with the Falcon show that they
are headed in the right direction.

BTW : Will there be a Falcon Mk 3 (or 4) with more RAM and processor power
beyond the 14MB Mark 2?

1970. defrag

From: julian@connexus.apana.org.au
Message-ID: <40af0r$2oj@preeda.internex.net.au>
Source record: 161023

I need a SCSI Data Adaptor Kit (Mounting Kit), to connect a
Quantum SCSI 2.5 inch Go-Drive to the normal SCSI 50 way ribbon
cable connector. I would like at least two kits but 10 would be better :-)

If not, where can I get the connector that plugs onto the 2.5 inch drive?
It is a 3M 150 series or Dupont 69764-050, 50 pin connector.

Prices?

I would appreciate any help or info at all.
Please email me directly. Thanks in advance,
Julian.

>

Gaven,

in order to make this official you need to post it to other newsgroups
as well such as newusers and newsgroup. I can help you make it as I've
planted two newsgroups this way before (programmer and announce).

However, unless there is a better argument than the one I am seeing,
I would have to say that I disagree to the creation of such a group. Mainly
because the term "recently" was used which is indeed very true. "Recently" is
becaues a lot of people are changing platforms and selling their hardware,
just to leave the atari platform (which is understandable). However this
implies that this newsgroup (seeing that the atari sin't a growing market,
simply shrinking) has a very limited lifespan AND it is not productive for
the atari commn`unity and its developers I would have to vote against it if
it was passed on the way it is.

I would be much more interested in the creation of a
comp.sys.atari.marketplace which offers support of sales and advertising
of companies and developers as well as second hand sales. FORSALE newsgroups
offer the "flea-market" impression (and actually marketplace does too in a
way).

Cheers

1977. Help: Character Set Conversion

Newsgroup: comp.sys.atari.st
Date: 1995-08-09 00:00:00 UTC
From: brian@zing.demon.co.uk
Message-ID: <807984834_OASIS_@zing.demon.co.uk>
Source record: 161025

I keep getting email from various mexicans, unfortunately my near inability to read spanish is made more of a problem by the lack of accents - and garbled email because (I'm assuming) of encoded data for including accents.

The emails in question include in the headers:
Content-Type: text/plain; charset="ISO-8859-1"; Name="Message Body"
Content-Transfer-Encoding: quoted-printable

My guess is that the ISO-8859-1 character set includes accented characters.
If this is right, then what I need is a program to convert form ISO-8859-1 to the Atari character set.
Does such a program exist?
If so - where can it be found?
If not - where can I get the information needed on ISO-8859-1 to write such a program?

(I'd hate to have to admit defeat using the Atari and have to transfer the file to a PC!)

Help needed fairly urgently!

There is a program around - run from the Auto folder called
ANTIBOMB.PRG. It has been distributed with cover disks, so I assume
it's available from one of the ftp sites.

It intercepts the Bomb display (which dissappears quite quickly) and
gives a GEM box with an explanatory text. May help.

I had a similar probem in my studio once and tracked it down to
interference from a PD desk accessory prog called (from memory)
INCONTRL or similar. Check non-proprietary software first (and that
is not a slur on PD authors in anyway !).

From: paa@hol.gr
Message-ID: <40b12r$8q6@newsflash.hol.gr>
Source record: 161028

I had the same problem with Screeblaster. Generally scrren expanders wait
for the v_opnwk() call (normally done by AES). Of course this is not the
case if you are not running GEM (of any kind). The solution is simple.
I wrote a program that simply opens and closes the PHYSICAL screen
workstation. That's enough to activate your screen expander before MiNT (or
anything else) runs.

If you want this little program just email me.

I agree with Gaven. And I don't believe it is really that new a thing. I have been grazing this newsgroup off and on since 1987, and there have always been a large number of "FS" or "For Sale" threads. Usually I am not interested in such threads and skip over them. It would be much nicer if there were a separate newsgroup for such threads.

I don't like the idea of a "Marketplace" newsgroup as much because I would be much happier to see new products and such listed in the "Announce" newsgroup, including dealership's special offerings.

I do not know what is considered sufficient traffic to have or continue a newgroup. c.s.a.st seems to have about 80 messages a day of late, and will probably pick up when colleges are back in session. At a guess, about 1/4 of that traffic is "for sale" stuff.

Binary Sounds ANNOUNCES !!! We have taken over the marketing and
distribution and support of The MidiTrack ST Series (SmpteTrack and
EditTrack), EZ-Track, GenEdit, EZ-Score and MidiMaze of Hybrid Arts
Fame. Stefan Daystrom will continue support and upgrading of the
MidiTrack ST Sequ encers. We are also lowering prices to make our
products some of the best values for the amateur, semi-pro and pro
musician!

Binary Sounds is operated by:
Rick Ladage and Bob Semaan in Houston, TX. USA
We can be reach by E-mail or snailmail or tele or fax!

Rick Ladage
Internet...bondservant@delphi.com
Bob Semaan

Hi there,
I went through some mail and found this:

> In a previous article, shunt@sb.dcs.uga.edu (Stephen Hunt) says:
>
>> I was told that it was possible to put a standard SCSI drive into
>> an Atari MegaSTe if a certain plug could be found on the
>> motherboard. Is this true? Mine is the 2 Meg model, with 720k
>> floppy.

> I don't know about actually putting a SCSI drive _inside_ a Mega, but
> if you use ICD's Link or ADSCSI+, you can connect a SCSI drive to the
> DMA port. The Link is $90 from Toad, and the ADSCSI+ is $99.

In the MegaSTe's that were distributed with a hard disk, there was always a SCSI interface internally - placed on a connector that's located beside the floppy connector. If there was no hard disk from the start, there should be some jumpers on the connector instead, to bypass it and get the signals to the DMA port instead. The interface is a small card with a few components, a 3 or 4 pole dip switch and a 50-pin flatcable SCSI connector on. If my memory doesn't play a trick on me, I think that there is an ADSCSI that's made especially for this internal connector in the MegaSTe. I don't think that Atari's own model is available anymore, since the MegaSTe is out of production. If the ADSCSI for MegaSTe isn't available either, the only possibility is to use the DMA port, in which case I'd prefer a LinkII.

Best regards,

Claes

Hello Phillip,

> How do you connect an internal SCSI disk to a Falcon? As far as I can
> tell the only SCSI connector is the external one. Is there an
> internal one as well?

Regretfully no internal SCSI connector - only the IDE connector is internal.

> I am trying to fit a SCSI disk inside my Falcon as well as the
> internal IDE disk. Is this possible? What happens to all the connectors
> on the back of the board if you put it in a desktop case? I thought the
> idea was to put everything inside the case.

I have a big towercase for my falcon and the solution for the SCSI is the same in all tower/desktop cases I've seen, with a cable from the external connector and into the case. All the connectors are on the back of the case. I believe that it's the most practical solution - even though it's a bit annoying to have a cable inserted in the SCSI port, just to go inside the case again. You could always try to solder a flatcable on the SCSI connector on the soldering side of the PCB, but I wouldn't recommend it.

> Physical space inside the falcon isn't a problem, it's just the
> connector. Also, is all that shielding *really* necessary? :)

The shielding isn't necessary for the computer's sake, but if you don't want to disturb radio and maybe some sensitive equipment, you should have the shielding plates - or a tower case (which is made of metal) - the plastic cover doesn't shield anything.

Best regards,

> solder a jumper wire on the board I would be most appreciative. Also
> which of the pins is the sending one so I can jumper the right pin.
> Thanks for any help. --

I would NOT recommend you to try soldering a wire in any way, since the serial
0 and 1 have a voltage of -12V and +12V, instead of the computer's levels of 0V
and +5V and this can damage your computer if you connect it wrongly. The most
probable cause of your problem is (if the connector itself isn't broken) that
one of the IC's that deal with the serial communication is broken or maybe even
some sort of software problem.
These IC's are named 1488 and 1489, two small IC's near the serial port -I
always seem to forget which one is in and which one is out and I don't have the
schematics at hand right now.
They are always soldered, so I suggest that you place a socket when you
exchange them - so you don't have to solder again if the problem comes back in
the future.

Good luck and best regards,

Claes

Hi there.

If I would build my harddisk recording system with a PC or Mac, it would have been at least twice as expensive and still wouldn't work better than my Falcon system. If you build a PC system, you'll need either Session8 or a Yamaha hardware thing that I've forgotten the name of and if your computer is a Mac, you'll need Session8 or some expensive cards to plug into the computer. There are cheaper alternatives for PC's, but I don't find it very funny to have to sync two programs together and when recording/editing have to switch between two programs, so I stick to Cubase Audio, which is the best - with no competition!

Ok, the PC might be faster than an Atari in some cases, but when talking about PC's - don't blame any other computers for using old technology -even if it's a Pentium, the technology is still the same as a 386! The 486 is in principal two 386's in parallell and the Pentium is in principal two 486's in parallell - impressive technology, isn't it?
Besides, everybody knows that the Motorola processors have a much more effective way of working than Intel, and that it's impossible to compare clock frequencies to see which one is faster.

If you'll switch to a PC, that's your problem and I wish you luck - you'll certainly need it.

Regards,

Claes

The LC would only do 8 bit colour at 512x384 res, same for the LCII. Of course,
you could get more colours with a VRAM upgrade (UK spec).

>> >What about the flagship Falcon?
> >
> >What about the Classic?

The Classic is a B/W machine at 512x384 res.

>What about it? They don't make 'em anymore. I think the lowest machine that's
>still in production is the 68040 based Performa 603. Even that will fade into

The *630* is now the entry level Macintosh #but# I think the 630 is being
killed off in december along with all the other remaining 680X0 machines
(this is just a rumour from a UK dealer).

>I think it's stupid that people continually feel the need argue about the ST.

>of the 400. However, I fail to see how spreading dis-information about Macs is

>supposed to make people feel good.

>15 bit color? That's dumber than a football bat! ^_^

I'm sure I read somewhere (a mac graphics feature or a spec sheet on one of
the new Mac's I setup for work) that Mac's have 15bit colour (32768) PLUS 1bit
for an alpha channel (transparency) = 16bit. Lots of dealers refer to Mac's
only having 15bit colour, and all the others say they've got 16bit, which,
in the end, confuses the poor old users!
Besides, whats 32768 colours between friends????? :#)

Update: Apple's spec sheet states 15bit/32768 colours on the 630 (I had one
delivered at work yesterday)

>the past when the new low end 603's appear. And what does this have to do
>with the Falcon anyway?

I agree !!!!!

Just thought I'd put my four quid in.....

1.4 is the latest that you can plug directly into an ST, (you'll have to set a few soder switches if your upgradeing from a 6-chip v1.0, no big deal) 2.06 is the* latest that can be put into an ST, it requires a special upgrade board to work. (Although I saw a text file on Compu$pend on how to install 2.06 without an upgrade board...)

So am I. Granted, I may new :)

It seems that you were correct after all. However, I also found out *WHY*
the bits are ignored.

16 bits. 3 colors (RGB). 16 is not divisible by 3 evenly. So you do 15
which gives you 5 bits per color. Yeech! So you just ship the whole pack in
a 16 bit parcel and things work more smoothly and you get an alpha channel
bit to play with.

Now that brings us to true 16 bit color. Since 16 is not divisible evenly
by 3 you're going to have to skew one or more of the colors (green would get
more bits or something like that) or do floating point based pixels :) :)

If you're going to be bothered with junk like this, you might as well just
do 24 bit color in a 32 bit packet. Then each channel is even, you're doing
damn near every color the eye can see, and you get a "real" alpha channel
that is as large as all the other channels.

So the Mac scheme is not as "unlogical" as some would portray it.

Anyway, I'm sure there's much better things to talk about in Atari group.

Lots of games and applications - original disks but no manuals -
for the Atari ST series. (Shipping not included for single item
purchases - will probably be $3) Want several - let's talk
turkey.

**********Games**********

S.D.I. (2 disk) (simulation) Mindscape $5
Shanghai (tile removal game) Activision $5
Shanghai (tile removal game-label obscured) Activision $3
Major Motion (arcade game) Michtron $5
F-19 Stealth Fighter (3 disk - simulation) Microprose $8
Test Drive (2 disk - driving simulation) Accolade $5
Silent Service (sub simulation) Microprose $5
Stunt Car Racer (driving simulation) MicroStyle $5
Rogue (adventure) Epyx $5
Time Bandit (arcade game) Michtron $5
Hex (good graphic strategy game) Mark of Unicorn $5
War Zone (shoot em up) Eidersoft $5
Leaderboard (Pro gold simulation) Access SW $5
World Games (2 disk) Epyx $8

*********Applications**********

Thunder! (comm software) Batteries Included $4
Word Writer ST (program and dictionary) Timeworks $4
Data Manager ST (database) Timeworks $4
Wercs (resource construction set) Michtron $4
Cornerman (desktop accessory) Michtron $4
Utilities Plus (utilities package) Michtron $4
Publishing Partner (v1.03) SoftLogik $6
Turbojet (printer software) Neocept $4
VIP Professional (integrated spreadsheet) VIP $4
Universal Item Selector (V3.0) A&D $4
GIST (sound tool) Antic $4
Personal Pascal (v2-) O.S.S. $4

Here's some great games for the ST line. All have docs. Shipping not included for single item purchases - usually $3) Want several, I'll deal, I want to move these out.

Advanced Dungeons & Dragons - Hillsfar SSI $24.00
Airborne Ranger (daner behind enemy lines) Microprose $15.00
Amazon (adventure) Telarium $10.00
Barbarian 1 & 2 collection Psygnosis $15.00
Battle of Midway - 1943 Capcom $10.00
Black Lamp Rainbird $6.00
Captain Blood (galactic adventure) Mindscape $12.00 (no manual)
Carrier Command (Strategy simulation) Rainbird $7.50
Corruption Rainbird $20.00
Chrono Quest Psygnosis $15.00
Cosmic Relief (Prof Renegade to the Rescue) Datasoft $6.00
Crack'ed Atari $6.00
Deja Vu (nightmare come true) Mindscape $10.00
Dive Bomber (sink the Bismarck) US Gold $12.00
Dungeon Master (D&D)+DM Guide FTL Game $10.00
F-16 Combat Pilot Electronic Arts $10.00
F-29 Retaliator (flight simulator) Ocean $12.00
Falcon (F-16 Flight simulator) Spectrum $10.00
Flight Simulator II Sublogic $8.00
Flood Bullfrog $8.00
GATO (submarine simulator) Spectrum $5.00
Gauntlet's 1 & 2 Mindscape $15.00
Global Commander Datasoft $8.00
Gold Runner MicroDeal $5.00
Golden Path Firebird $15.00
Gone Fish'n (bass fishing simulation) Interstel $10.00
Gunship (helicopter simulator) Microprose $7.50
Harley Davidson-The Road to Sturgis Mindscape $12.00
Harrier Combat Simulation (flight simulator) Mindscape $10.00
Hunt for Red October (submarine combat) DataSoft $7.50
Invasion Michtron $6.00
Jet (F-16 or F-18 vs Mig-21 or 23 Dog fights) Sublogic $8.00
Kennedy Approach Microprose $15.00
Knight Force Titus $8.00
LCS Wanderer Pyramid SW $3.00
Midway Battles (WW2 simulation) TDC Dist. $4.00
Murders in Venice (adventure set in Venice) Cobra Soft $15.00
Nine Princes in Amber (adventure) Telarium $12.00
OO-Topos (interactive novel) Polarware $8.00
Overlord (d-day invasion simulation) Scorpion $18.00

Phantasie II-The Wrath of Nikademus SSI $10.00
Pirates of the Barbary Coast (Strategy Action) Starsoft $7.50
Populous (world simulation - 4 scenarios) Bullfron $15.00
Prime Time (tv network simulation) First Row $10.00
Project Neptune Epyx $4.00
Razrats-the match J. Nolan $3.00
Red lightning (WW3 simulation) SSI $12.00
Rogue (adventure) Epyx $10.00
S.D.I. Cinemaware Prod.$12.00
Sentry Firebird $6.00
Shadowgate (heroic fantasy) Mindscape $10.00
Shanghai (tile game) Activision $12.00
SimCity (City simulation) Broderbund $15.00
Sinbad and the Throne of the Falcon Cinemaware $12.00
Sky Chase (fast smooth jet flight simulation) Broderbund $12.00
Space Conquest - A Galactic Odyssey StarSoft Dev. $6.00
Space Harrier (space flight sim) Sega $6.00
Space Math (educational game) Intracorp $5.00
Space Quest (3d animated adv) Sarien Encounter Sierra $10.00
Speed Buggy (race) Data East $8.00
ST Star Raiders Atari $15.00
Star Trek-The Rebel Universe (graphics adv) Paramount Pictu $20.00
Stellar Crusade (exploration,strategy,conquest) SSI $10.00
Steve McQueen West Phaser (old West Simulation) Loriciel $8.00
Stunt Car Racer (race stunt cars) MicrO-Style $10.00
Sub Battle (sub simulation) Epyx $10.00
SunDog Frozen Legacy (classic adventure) FTL Games $12.00
Tanglewood MicroDeal $15.00
Targhan (adventure) Silmarils $12.00
TechnoCop US Gold $6.00
Temple of Apshai Trilogy Epyx $15.00
Test Drive (driving simulation - 5 car choice) Accolade $7.50
Trivial Pursuit - A new Beginning Domark $20.00
Uninvited (adventure) Mindscape $10.00
Universe II Omnitrend $12.00
Willow (cinematic adventure) Mindscape $15.00

Collections:
ST Five Star (Crazy Cars, Rampage, Barbarian
Wizball, Enduro Racer) Ocean $15.00
Light Force (Bio Challenge, R-Type, Voyager) Ocean $12.00

2008. Re: is there a decent defragger for the atari?

Newsgroup: comp.sys.atari.st
Date: 1995-08-10 00:00:00 UTC
From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DD3Jun.EHy@cf.ac.uk>
Source record: 160958

The best is by far Diamond Edge, now available in a new version. It's reasonably priced (approx ï¿½40) and not only defrags but checks for lost clusers, and other problems that could lead to eventual corruption and disaster! It's indispensable and certainly worth the hardship caused by losing data on your hardrive!

Bingo. There is far too much commercialization of the net already.

I would guess that "wanted" and "for sale" posts from individuals would generate more traffic than what we are seeing in the comp.sys.atari. programmer newsgroup (the latest one to be added). It might indeed be seasonal but I still think it is a logical move.

If it comes to a CFV, I'll vote "yes" for it. I'm generally opposed to making additional newsgroups without good reason, but this one qualifies, IMHO.

Yes, but the faq's can be immediately read by all and are appropriate here.
Still, I know what you mean. We waste more space in this newsgroup from
horrendously long .signatures, "me too" replies, and those vapid people
that insist on including the signatures of posts they reply to. Duhhhh...

> BTW: can't you just skip the message if you see it's marked as "long"?

That's a common misconception as not all newsreaders are built alike.
I've seen some newsreaders that suck down the entire contents of the
newsgroup "file" and you get it all, like it or not. An inconvenience
for most, a waste of money for those that pay for their net access.

> but now I know better.

No worries. Thanks for being considerate.

m> And the ST-book. And the...

Atari didn't keep the Falcon 030 secret very well. There was
rumours of it more than a year before it was released.

Even if this machine would exist (which I doubt), it would
take Atari too long to get it in the markets, I think.

But, this machines specs sounded just cool. I would buy it
if it'd be reasonably priced.

m> Let's all just hope for a miracle... This platform really deserves it.

Yes it does, but don't hope too much. Life sucks. ;-)

>I think), the event Timer will not work properly. Not sure how
>to run Event_Multi to work when the file selector is up, though.

From my scant understanding of GEM it would appear that both fsel_input()
and form_do() suspend program control, so you'd need your own file selector
and dialog box handler. Desk accessories also pose a problem. I think
there are just so many complications that if (by some absolute fluke) this
thing did ever see the light of day, it would be totally unusable. But
it's not going to be any time soon, that's for sure.

The online part of OASIS is still NOS, so if you have had no problems
with this, go ahead and use OASIS. To the best of my knowledge OASIS has
always been compatible with MultiTOS.

2025. NOS/OASIS and dynamic IP allocation

Newsgroup: comp.sys.atari.st
Date: 1995-08-10 00:00:00 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <DD418u.L68@freenet.carleton.ca>
Source record: 160975

Is there anyone out there who could shed some light as to why NOS/OASIS cannot handle dynamic IP allocation? Is there any way of getting around this, as, for a lot of Atari users, this combo of utilities would go a long way towards providing "painless" net access. Just curious.

2028. Ghostlink?

Newsgroup: comp.sys.atari.st
Date: 1995-08-10 00:00:00 UTC
From: gwood@tibalt.supernet.ab.ca
Message-ID: <40dta9$i9u@tibalt.supernet.ab.ca>
Source record: 160978

Hello there everyone.

I've been trying to use the Ghostlink ST-to-PC transfer program (a beta version I found on GEnie). For the life of me, I can't seem to get it to work. Anyone have any ideas? I'm running a Mega STe and a 486 DX/2, connected by a null modem cable. I can't so much as get Ghostlink to even recognize that the PC exists, much less transfer data.

Appreciate any help anyone can give me. Thanks in advance.

Even more impressive are the people that form Toad Computers. Dave Troy and Ray Mitchell have been supporting Atari users for years and Dave's lovely wife, Jennifer, is very nice and knowledgable, too. I haven't had any dealings with Zoe (the dog) as yet, however.

Anyway, they've taken the risk to become _the_ US supplier of all things Atari and have done a very respectable job in the process, IMHO.

-Hutch- @ Fair Dinkum Tech

P.S.: Dave, where is my latest endorsement check? :)

Dieter F. has one thats called AQT_PLAY, I think. It doesn't handle every compression format, nor sound, but might allow you to get a glimpse of what's on your CD's. I believe it's at HENSA, and probable ftp.uni-kl also.

2035. Falcon and HTML WWW Development...

Newsgroup: comp.sys.atari.st
Date: 1995-08-10 00:00:00 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <J3OCiFQ.ari2550@delphi.com>
Source record: 160985

Having recently gotten into the so-called multimedia industry recently,
I'm surprised that there hasn't been any serious push by Atari users and
developers to make the Falcon a HTML WWW development machine.

I think this is actually one area where the Falcon can excell - afterall,
it has excellent (albeit slow) graphics capabilities and great audio
hardware and it certainly has its share of hi-power gfx tools like
Aprex Media, Rainbow, & Gemview.

If you users want to see the platform survive you got to help make a
niche for it.

Just my thoughts on the matter...

Ari

I have the following for sale:

- 520ST w/ 1MB RAM and spring-loaded keyboard
- 2 floppy drives (ss and ds)
- Atari color monitor
- Atari hi-res (b/w) monitor
- monitor switch box
- miscellaneous games and software (Star Trek, Oids, Flash, couple of word processors, and I will have to look to see what else I have).

Make me an offer -- I will consider all offers (ridiculous or not). I'd like to sell the whole lot but will consider selling in parts.

And to give you a warm fuzzy feeling, all the money raised through the sale will go towards acquiring a puppy. ;)

For those in the greater Seattle area, I will deliver.

-Young

>It seems, that C-LAB will release a new TOS-version in the next few months.
>I have heard, that the price will be around 75 DM.
>This information is not 100% sure, but lets hope, that they will really release
>new TOS-versions.

C-LAB tries do mimic Microsoft when selling beta versions of operating
systems. TOS 4.92 is about two years old now and Atari themselves didn't
release it because it's incomplete and buggy. C-LAB doesn't seem to care
about this if they really are going to sell such a system to customers
foolish enough to buy it.
BTW, I have some unfinished programs of my own that are several years old,
too. Anyone willing to buy them? I think the price will be around 75 DM.

>a number of months (I'm basically converting over to Linux).

You do know that Linux runs on the TT don't you? I'm sure Linux/68k
and X11R6 aren't as easy to install as on the PC (I've done the former
for my Falcon), but I can attest that it's a fully functional Linux!

As a matter of fact, the system you have sounds like an ideal platform
to run Linux/68k.....I wish I owned a TT, my Falcon only manages
to crank out 3.95 BogoMIPs.... :(

Take it easy!

>(by shielding I mean the metal sheets screwed on to cover up the board)
>What is likely to happen if I take some or all of it out?

It depends where you're operating your computer. In a domestic
situation it is very unlikely you will have any problems if you remove
the shielding. You may get interference on your television or radio if
it is too close however. In an industrial environment (where it may be
close to switchgear, or automotive machinery) the electrical noise can
upset the computer (and even corrupt RAM contents). I suppose it is
possible that the hard disc could get corrupted by high magnetic fields,
although I doubt that the flimsy shielding in the falcon would reduce
the field strength by much anyway.

There was an article in the french ST Magazine a few months ago (or was
it last year?) about all those weird Atari machines. There were a few words
about the Sparrow (which was the Falcon040) the MagicBox (which from what
they said, appeared on Tramiel's desk at several news conferences, but it
was so small nobody ever noticed, any details anyone?)

There was also a paragraph about a whole stock of experimental transputers
that was bought by Kodak just before they started their Photo CD development.
Apparently their were about 30 of them, in plain ST cases, all connected
together in big racks. Now this seems strange because I thought transputers
came in Mega ST cases.

Anyone working at Kodak listening?

I'd give more dtails about this article if I had some time. Unfortunately
I haven't.

Cya,

Nick

I am posting this for a friend.

He has a:

520ST w/rf jack
color monitor
DSDD disk drive with a brand new mechanism
various disks with a lot of PD software on them

asking $150 canadian, negociable.

When writing back, I will probably not have access to this account until
about the 27th of august, so if I'm a little late at getting back, don't
worry, I'll get back to you.

Thanks for your time,

Joseph Hogan

From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DD55Lt.4MC@cf.ac.uk>
Source record: 160912

Can anyone help.
I'm looking for a good quality colour digitiser to use on the Atari TT. I've already got Videomaster, but the quality is crap (16 grey levels at 320*200), I wonder if Vidi12 st would work on a TT, I've heard it has problems with the cartridge port. So far, my only option appears to be the MatDigi option for my matrix card, that does 24-bit in hi-rez but it's very expensive. Has anyone tried the colour splitter (RGB) for the videomaster, and if so is it any good? At the moment it seems cheaper to buy a second hand pc and fit a digi to that!

Simon.

2071. [Q] WP: Different size fonts for printing

Newsgroup: comp.sys.atari.st
Date: 1995-08-11 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <40e8tl$lc8@status.gen.nz>
Source record: 160917

Hello,

I am trying to find a Word Processor which can use the inbuilt printer fonts of a HP Colour Inkjet Printer. Prefereably it should have the support as a point and click function, rather thn having to add the printers escape codes by hand, but if there is no other way around it, then that would be better than nothing.

It would be good if it was PD or Shareware, but if there are only commercial programems to do this, than I would like to know anyhow.

Thanks for any help!

It was none other than mcneely@binah.cc.brandeis.edu who did write on 10 Aug 95 that .... m> I am looking for a spread sheet program for an Atari 1040 st can anyone m> out there tell me wher I can buy software for the Atari and give me an m> opinion if they have used a spread sheet program that was good. m> I am not an Atari knowledgable person. m> Thanks in advance,

Three programmes spring to mind ,None have been upgraded for some time but at least will work fine with Falcon so are good for ST.
LDW Power .. LOTUS123 Clone and very good too , you can pick this up new for about 10 quid if you shop around.
OPUS 2.3 Again a Lotus clone but shareware (But no longer supported shareware so no registration available)
Sheet . Another Shareware Offering that has less of the nice GEM face of the above two but some very nice macro functions in it (Uses a Basic like interpretor rather than a lotus macro type) . I haven't a clue as too the current status of this ,haven't seen any version upgrades but then it worksfine as is

The above are all very good considering they are all about 5 years old now
I heard a rumour ages ago about a new version of LDW but I really doubt it is going to happen.

2073. NVDI vs Warp9

Newsgroup: comp.sys.atari.st
Date: 1995-08-11 00:00:00 UTC
From: bikerbob@wchat.on.ca
Message-ID: <DD4s1I.L9n@wchat.on.ca>
Source record: 160919

I have a question to any who might have any useful information on these utilities.

I want to try and speed up my STE as fast and a cheaply as possible. Now the first is with these screen accellerators.

I have Warp 9... I do not think it is the latest version to be released. I have read a great deal about NVDI from the UK magazines.

Does anyone have an stats and opinons as to which is better from the accelleration point of view. Now Warp 9 has the screen saver stuff but NVDI has the new GDOS routines written in as well.

Anyone, help please.

James

2074. Wanted to Find

Newsgroup: comp.sys.atari.st

From: bikerbob@wchat.on.ca
Message-ID: <DD4s9t.n0q@wchat.on.ca>
Source record: 160920

There as several items that I am trying to find for my STE

First is an accellerator board. Either a ADspeed 16 or a T28 or something.

Also anyone with any info as to how useful a board on there is would be helpful... just how fast does a ADspeed or T28 really go. What does the speed help the most... do you have to disable it some of the time or more than you would like???

And I would like to ask any and all Spectre CGR users out there if they have come across the program Async LaserWriter... so that you can print direct in MAC mode to a postscript printer through the serial port.

Thanks

James

: Is the shielding *really* necessary inside a falcon?
: (by shielding I mean the metal sheets screwed on to cover up the board)
: What is likely to happen if I take some or all of it out?

Yes, it is *really* necessary. SHIELDING has its name for a reason. It shields out unwanted radio frequency interference and shields external devices from the Falcon's own radio frequencies. You are better off getting a bigger case to put your Falcon in so you have the room. A metal tower case has excellent shielding and plenty of room.

Besides, removing the shielding hinders the air-flow from the already wimpy fan.

You may be able to operate your Falcon for months at a time without any problems and complaints from your neighbors (if you're lucky), but say "bye bye birdie" if someone decides to key in their 500 watt linear CB amplifier near by.

You have been warned :-)

My ATW came with Helios, and Perihelion allowed me to upgrade (perhaps
they changed their policy when Atari dumped their stock? Couldn't
blame them for that.) So far everything works except the X driver
(can't get my SVGA monitor to sync to the ATW's VGA-like modes).
Disc access is slow, but works. (The disc drives are pretty old, but
I think that going through the chain Morpheus->STRAM->iserver->tp-link
has something to do with it. Anyone seen an ACSILA lying around?)

Source record: 160929

In a previous article, mbecroft@iconz.co.nz (Mario Becroft) wrote:

> I have heard that this drive is being released later this year and at a
>very cheap price. (5 1/4" media) Does anyone else know about this?

Yes, I just read an article about it in the latest MacUser magazine.
It's called the "Jaz" and uses a standard 3.5" Winchester hard-disk
technology enclosed in a cartridge, similar to the Syquest units.
I don't know what you consider "very cheap" but it's expected the Jaz
drive will go for around US$600 (internal version $500) with 1Gb
cartridges selling for around $125 each. The Jaz can also read 540Mb
cartridges ($69). It's a SCSI-2 device with a reported 10Mb/sec transfer
rate, 12ms average seek time and 17.5ms average access time. It has
automatic SCSI termination and user-selectable SCSI ID. The case is
similar, although somewhat larger, than the Zip drive, is dark
green in color and can be stacked vertically or horizontally. It
weighs about 2 pounds and although the article didn't say, I imagine
it will come with an external power supply due to the small case. All
this information is based on a press release, not hands-on testing.
Iomega's phone numbers are 800-697-8833 or 801-778-1000.

Iomega's Zip drive is attractively priced at US$199 but 100Mb per cart
is too limiting and 29ms too slow for me. The new Syquest 135 (directly
competing with the Zip) looks a lot better with it's 13.5ms average
access time but it costs a bit more and it still stores "only" 135Mb
per cart. The Jaz unit should fit the bill nicely for those that need
massive -removable- storage. But remember, you can still buy an external
fixed hard drive for less, including the case and power supply.

> I was hoping it might be a marvellous replacement for the bad Syquest
> 270 removables (I am on to my 3rd replacement) and recording D2D with
> the Falcon...

Ackkk! What's wrong with the Syquest 270 unit? I just bought one (second
hand at a -very- good price with 4 carts). Should I expect problems???
Or is it maybe that you have just been, er, "lucky?" ;-)

2084. Problems with GCC and GNUmake

Newsgroup: comp.sys.atari.st
Date: 1995-08-11 00:00:00 UTC
From: oberle@informatik.uni-koblenz.de
Message-ID: <40fjdf$mtl@newshost.uni-koblenz.de>
Source record: 160930

Hello everybody,

I have a problem getting GCC and GNUmake running
on my machine. This is my configuration:

TT, 4+4 MB, runs in 1280x960 mono
MagiC 3.0, NVDI 3.01, Gemini 1.A

Free ST-RAM: 2.650.190 Bytes
Free TT-RAM: 2.995.626 Bytes

FIRST PROBLEM: GCC

GCC is installed on an own partition (k:), including
the required directories (bin, include, g++inc, lib).
The compiler itself can be found under \bin\gcc-cc1.ttp
and - for C++ - under \bin\gcc-cc1p.ttp

Environment variables are set in MAGIX.INF according
to the README file (GCC_EXEC_PREFIX etc.). I've also
included k:\bin as path for executable files (PATH).

In k:\work there are my current workfiles, i.e. at
the moment the only one is hello.c :

```
#include <stdio.h>

void main (void)
{
printf ("\nHallo Welt, ich bin da!\n");
}
```

BEHAVIOUR (in Mupfel) :
----

1) Start with "gcc hello.c"
There doesn't seem to happen anything. There also
isn't any error message.

2) Start with "gcc"
I get the message "gcc: no input files"

3) Start with "k:\bin\gcc-cc1p.ttp"
The compiler starts and immediately throws out an error message
for line 1 (#include <stdio.h>): "undefined or invalid # directive"

HOW DO I GET THIS F...ING PROGRAM COMPILED?

SECOND PROBLEM: GNU MAKE

GNU make can be found on the same partition (K:) in the
directory /make. If I start make, I get the message
"make: not enough memory".

Is this possible? Are about 3 MB of remaining TT-RAM not
enough to get make running?

HELP!

Christoph

OXYD is one of the best shareware puzzle games. You can even play it with
two persons via modem or midi.

If you have a WWW browser, check out "http://dongleware.web.de".
It should be available on Compuserve, too.

2086. SLIP connection probs

Newsgroup: comp.sys.atari.st
Date: 1995-08-11 00:00:00 UTC
From: Ein Auslander <replicant@bOilERhOUSE>
Message-ID: <Pine.LNX.3.91.950811204516.8615A-100000@prometheus.hol.gr>
Source record: 160932

howdy!
I do not know whether it was a good idea or not, but having some time to kill
i decided to install mintnet the other day...
So i downloaded the TAF diskset from hensa, followed the instructions, and
all (mint/chimera/x-windows) installed o.k. (i guess so :).
I'm now trying to get a working SLIP connection. I'm not using a script yet,
i want to do it manually first by going into term mode (via DIP). I dial &
login as usual and then exit back and enter SLIP mode. This is what i type:

```
get $locip 127.0.0.1
get $rmtip <ip# of my provider>
default
port modem2
term
<login>
^]
mode SLIP
```

and then it's problem time:

1) If i select the www browser option from the pop-up menu i ALWAYS get this error:
"exec: chimera: no such file or directory (or pid)"

Any idea how i can avoid this? Chimera runs with no probs every time i boot
as defined in .xinitrc

2) If i want to use ftp, then the ftp-window appears o.k. and i can connect
to an ftp site allright...i login ok, i cd to any directory i want ok...but
(there's always a but) if i try to 'ls' or 'get' a file the damn thing hangs
there even though the modem does seem to receive & send data for a moment.
It hangs and it hangs until i get thrown out for inactivity. So i kill
the process and retry..It gets worse! I then get "host name lookup failure"
and i can't even connect...

Needless to say i'm no guru at this and any help is appreciated. :)

Where is this latest version of Junior Office available? It
doesn't appear to be at HENSA or on the other major FTP sites. The
latest version of Junior Office I have seen is 2.01.

msa - Magic Shardow Archiver. A utility that compressed a disk image into a
file for up/downloading. You should be able to ftp from
src.doc.ic.ac.uk/computing/systems/atari/umich/...

Run it, select the file and it will format a floppy and create the disk image.
Then run the disk (it may be a auto-booter). Can't help with the other stuff
though. Sorry :(

I also use a Mega STE with a Deskjet500 and Notator(V3.15). I use it
constantly and have few problems. It DOES freeze very occasionaly during
printing, at the end of a line, but this is not common.
What version of Notator do you have? and what are your printer settings?

2092. Help! What's wrong with my HD?

Newsgroup: comp.sys.atari.st
Date: 1995-08-11 00:00:00 UTC
From: "Paul E.S. Brown" <brownp@soc.plym.ac.uk>
Message-ID: <40fs0f$bmh@auntie.bbcnc.org.uk>
Source record: 160938

Something seems to have gone wrong with my Hard Drive, can anybody help?

As of last night, when I boot up my ST from the Hard Drive I get the message: 'Insert disk into drive A:` (whether there is a floppy in the drive or not) and when I click on the proceed button the system re-boots, and hence I am stuck in a loop.

The only way I can boot the system is with the HD switched off.

I think either a virus has hit my system or something is wrong with my HD. Can anybody help.

Thanks in advance

Paul

2093. Help: English Mupfel?

Hi,

I have heard from a number of people that an English version of
Mupfel is or should be available. Which is true and if there
is an english version where is it? I have seen the German version
and it looks quite good, but without any ability in german it has
limited use. Thanks.

Source record: 160944

There is always a way to access your hard-drive provided it hasn't died.
If you are using ICD utilities, there are docs explaining how to do it..
With Supra, you have to go about it a little differently. I have the docs
for both lying around here somewhere if you need them. It sounds like
you may possibly have added too many Acc's or files in your Auto on the
HD...it happens to all of us now and then. Or you have changed your
bootup systems on the hard drive... If I can help you, let me know.
You are aware that you need to defrag/optimize your Hd now and then to
keep the garbage off it so it won't screw up, right?
Good Luck.

: I have a question to any who might have any useful information on
: these utilities.

: I want to try and speed up my STE as fast and a cheaply as possible.
: Now the first is with these screen accelerators.

: I have Warp 9... I do not think it is the latest version to be
: released. I have read a great deal about NVDI from the UK magazines.

: Does anyone have an stats and opinions as to which is better from the
: acceleration point of view. Now Warp 9 has the screen saver stuff but
: NVDI has the new GDOS routines written in as well.

: Anyone, help please.

: James

FWIW, I have NVDI version 2.5 which I DO NOT USE because it screws up
Cubase (3.1 and Score 2) on me.

There is only ONE other person I know of in the world who has had a
similar problem - everybody else thinks its the best thing.

Try this test: Load Everest and enter a short bit of text. Now click
the mouse in the upper scroll bar (shaded part) and the lower scroll
bar repeatedly. After about four cycles the Atari STe will crash.

Do this WITHOUT NVDI and it works fine.

Hope this helps but remember - this is only MY experience and (AFAIK)
only ONE other person in the world. So make up your own mind.

John.

Go for Diamond Edge. I tried Zorg (one of the recent versions), but found it unstable with my hard drive (Protar Progate 40). We use Diamond Edge 2 at University, and the only time it has ever crashed was when I deliberately nested a file in a huge number of subdirectories to test a recursive file search routine I was writing; seeing as the desktop and MagiC also crashed, it's probably not the kind of thing worth doing every day!

Richard.

You ARE running PCSLAVE.EXE in the PC, aren't you? Thought it worth asking as usually there is no prob. with ghostlink apart from getting a decent match on the comms. speed. Normally you will just get a few "duff transfer" displays until you get the speed right.

What about the serial port at the ST end. Have you set the speed with CONTROL.ACC (or similar), have you removed all handshaking (RTS/CTS, XON/XOFF) as per instructions? Do you have the data bits/parity/stop bit set as per instructions?

2110. The new bumper ST Format

Newsgroup: comp.sys.atari.st
Date: 1995-08-12 00:00:00 UTC
From: robotron@moroder.demon.co.uk
Message-ID: <199508120007.AA00046@moroder.demon.co.uk>
Source record: 160857

The September issue of ST Format (issue 74) is the first to be stapled and looks extremely flimsy as a result - I really felt like Mr Stupid when I handed over £4.25 for it. Closer inspection revealed that only 13.5 of the 84 pages were adverts, and only 9.75 pages' worth were not for other Future publications. Hence the extortionate price, I'm sure. No magazine can stay afloat for long with such feeble advertising revenues, and I'll be surprised if STF is still around a year from now.

On the plus side, there was much more space for articles and I have no complaints about the content. Better still, there was a reader's letter pointing out that the Good Times virus was a hoax (what an embarrassment it was to read that warning on the STF News page) and another which described Team as "totally unplayable".

Source record: 160859

Out of the ether, the following was mentioned by Sander...:

SS> Note: Under MultiTOS things work fine, but with the AES 4.1 kernel
SS> I also get the `mouse droppings' sometimes. It's not relaxing to
SS> work in the lower part of the screen when the system can freeze up
SS> any time...
Hmmm, when using 4.1 I don't recall getting any mouse droppings? I will have
to reinstall Multitos and give it a proper test.

2113. Re: RFD: comp.sys.atari.forsale

Newsgroup: comp.sys.atari.st
Date: 1995-08-12 00:00:00 UTC
From: szhays@bullwinkle.ucdavis.edu
Message-ID: <40gv2b$op3@mark.ucdavis.edu>
Source record: 160860

Actually, an even better idea might be to create a newsgroup in the misc.forsale.computer heirarchy, such as:

misc.forsale.computer.atari

The real problem I see in converting peopl to this line of thought is that most people would either ignorantly continue to post forsale posts to c.s.a.st, or would post here for fear that no-one is reading the "for sale" group. As both issues contradict the principals of the Usenet structure, I don't see them as holding merit. An RFV for either comp.sys.atari.forsale or misc.forsale.computer.atari would get a yes vote from me.

2114. Re: falcon "extender" upgrade?

: 40MHz (dependably), has room for 16MB of TT Fast or standard SIMM's,
: built-in screen enhancer AND it will accept the original Atari Falcon
: RAM card (4MB, I'm

This sounds a lot like the Hawk that Wizztronics is (supposedly) selling here in the US. Here is Wizztronic's 7/28 post to GEnie describing the Hawk (by the way, someone was asking for the Wizztronics e-mail address earlier, it looks like s.cohen27@geinie.com should do):

------------8<---------------8<------------

Atari-ST RoundTable, Category 26, Topic 7, Fri Jul 28, 1995
S.COHEN27

The Hawk is scheduled for a late September release. The Price as it stands on 7/28/95 is $725.00 USD $800.00 with the ram option, please keep in mind these are Retail prices for the 48 MHz model.

BTW The Barracuda is not dead, it has been placed on the back burner for a while so we can iron out the OS problems we were having.

meanwhile

If you want to use your old 882 it has to be a PGA, because that is the socket the Hawk is being fitted with.

The Hawk is 100% compatible with all existing software, here is the newest feature list sent to Distrubitors:

From Wizztronics

The Hawk is a Falcon 030 Accelerator that incorporates a Motorola 68030 Microprocessor operating at speeds from 33 MHz to 48 MHz

* NEW FEATURE * We are now adding Video Acceleration as part of this overall Accelerator, for even better performance.

System Specifications

The Hawk is configured as follows:

Plug and Play design for ease of installation.

128K level 2 cache expandable to 256K

32 Bit System RAM, Made for plug and play with the stock Atari Ram board (supports 4 or 14 MB ram card or 72 pin sim module).

32 Bit System ROM.

32 Bit TT compatible extended Ram up-to 64 Megabyte using 4 standard
32 bit sims. **

Enhanced Video capabilities extending the palette some examples are:

448 x 512 True Color

896 x 512 256 Color

1280 x 960 in 16,4 and 2 color modes

* New Feature * Video Accelerator 1 Megabyte, and 2 Megabyte Video
Ram models. Reduces Processor time needed for screen updates, by
up-to 75% for faster Video

Expandability and Flexibility

Video port connector for the addition of the Video Funnel (Frame
Grabber) and the VES 2000,3000, and 5000 (Video Editing System) 96 pin
VME style connector for add on peripherals i.e.: 486 PC emulator card
Addresses up-to 64 MB of TT local Fast Ram using Standard 72 pin, 32 Bit
sims, in both 4 Megabyte and 16 Megabyte Modules.

Performance Factor
100% compatible with all existing software.
Current Falcon Benchmark 3-4 Mips.
With Hawk Accelerator 16 Mips @ 48MHz.*
Video acceleration over 100% (resolution dependent).
400% to 500% Raw Speed increase over a Stock Falcon.*
Enhanced DMA access.
1 Wait State ROM.
0-2 Wait State System Ram.
0 Wait State TT Fast Ram.

* Based on Preliminary test Results
** plug in option (logic Intergrated Circuit)

MSRP 725.00 USD
1 Meg VRam, 128K CACHE Ram Expansion on board

**64 MB Ram option (logic IC) add $75.00

Hope this answers a few questions

Steve Cohen

2120. Re: Heard of Iomega 1 gig removable drive?

Newsgroup: comp.sys.atari.st
Date: 1995-08-12 00:00:00 UTC
From: jperez@uhunix3.its.Hawaii.Edu
Message-ID: <DD68tu.8x7@news.hawaii.edu>
Source record: 160867

In case anyone is interested, I have been looking into the Olympus Magneto Optical drives (From Deltis). I haven't been able to determine whether they will actually work with Atari computers as yet... They ae SCSI mechanisms.

Deltis 230meg MO, 4200rpm, 2.44meg/sec data transfer rate, 18ms seek $ 600
Deltis 1300meg MO, 3500rpm, 3meg/sec data transfer rate, 17ms seek $1700

Of course, Magneto-opticals are _significantly_ more robust than other forms of magnetic media. 230meg disks can be had for $30, 1.3gig are about $80 a piece.

2121. UK National Lottery Program Now Available

Newsgroup: comp.sys.atari.st
Date: 1995-08-12 00:00:00 UTC
From: Mark Butler <Mark@dwell.demon.co.uk>
Message-ID: <419138879wnr@dwell.demon.co.uk>
Source record: 160868

Following on from Lottery Companion 1 which achieved 60% in ST Format,
I've just completed version 2.

Rather than posting the program straight to the Newsgroup and
increasing everyones phone bill, I will instead send copies direct to
anyone interested - Just mail me.

The program will be included in UUE format, and will produce Self extracting
TOS files.

Anyone not familiar with this can send me a Disc and S.A.E. to
8 Brookside, LE10 2TL, UK.

Note that the program is Shareware, and if you use it the Registration
fee is Five Pounds to receive the registered version via Email, or
Seven Pounds via Post.

Features include:

Up to 7007 Number Set entries per file

Random, Manual, Hot, Cold, Range and Wheel with up to 5 Banker
selection.

Friendly Window and RSC display.

Range of Statistics displays including Bar Chart, Frequency, Hot/Cold,
History and Pattern. the last two include every ball drawn in order and
Machine and Ball Sets and date of draw. you can also 'Filter' the stats
to isolate information such as the performance of a particular machine.

Edit data sets and stats files.

Compatible with all Ataries including Falcon.

Why not take a look?

FWIW, my Pmac 8100/100 displays 32768 colors in 16 bit mode. 15 bits for
color. Then there is 32-bit mode which uses 24 bits for color. I have
verified this through my research from 'Inside Macintosh' books (developer
books).

2130. Magic Mac problems with 8100/100 AV

Newsgroup: comp.sys.atari.st
Date: 1995-08-12 00:00:00 UTC
From: ralunsfo@uncc.edu
Message-ID: <40j4mf$ilf@news.uncc.edu>
Source record: 160877

First off, does anyone have an email address for the company that is responsible for MagicMac?

Second, I'll describe the problem I had for those that are interested. Downloaded the Pmac demo version of MagicMac, ran it. The first time I tried, it worked fine. It was beautiful. When I tried to exit from the demo, my computer froze. Ok, my computer does this from time to time (as computers do), so I thought I'd just reboot. Well, I tried to reboot, then the computer would not recognize the internal hard drive. This does not happen from time to time. No problem (I thought), Norton will fix it. Whipped out Norton, which fixed some of the problems, then aborted saying that it could not fix all the problems. Basically, I had to reinitialize my hard disk to get it to work again. I was not happy.

Being the optimist I sometimes am, I decided that it could have just been some kind of system fluke, and tried to run it again ('bout a month later). This time, I did not even get into the demo...it just crashed before opening. Same result (though this time I did have more stuff backed up <- net result, I didn't have to start Dark Forces all over again :)

Just posting this so that anyone with a Pmac, or more specifically an 8100/100 AV, will be cautious when trying this demo out.

BTW, I trashed the demo file after the last crash...Then thought about it rationally and decided I should at least submit a bug report :)

>
> The Jaguar is a renamed Panther...

No it isnt. The Panther (32-bit sprite shifter) was in production in parallel
with the Jaguar (64-bit powerful thingy) but the Panther was shelved because
the Jaguar development was going so quickly...

I think Jeff Minter had an early Panther to play with... Although this may
be wrong, I'm not definite...

>
> It was just a thought.

Hmmm.... Add a keyboard to the Jag (there is a port on the back)...
Add a diskdrive (you could do it through the ROM port, like the toilet
CD add-on)... Add JAG-TOS (TOS 2.06 with Tom and Jerry supprt?) and,
voila, a Jag computer...

It's almost possible as a 'Home Hack' if someone wants to write the TOS
for it! :)

You could also emulate an ST/TT/Falc (sound/video) using the Tom and
Jerry chips to give full ST/Falc/TT software support...

Sounds good to me. All the parts shouldn't cost more than 60 quid in all
and a Jag is only 150 quid... A supercomputer for 200 quid? :D

I can dream...

> I use my Atari(s) for video titling and special effects for music
> videos (among many many other uses) so this could add a real edge to
> my future-retro funky folk rock videos.

The Trip-a-Tron program itself is Shareware. You should be able to find it on
an FTP site somewhere. A quote from the README:

This is a shareware release of Trip-A-Tron. The software is
complete, but to utilise all the features you will need the
manual. This is available upon payment of the registration
fee of ten pounds UK, twelve pounds overseas (to cover excess
postage etc). The program works on all versions of
the ST, but there is a bug in the release version which means that
the file selector does not work properly on STEs and later releases
of TOS. You can get the fixed version at the same time you
register - just ask for the STE fixed version. (However, the
STE Fixed version requires 1MB of RAM).

-end-

Anyway, Jeff Minter has gone on to bigger and better things, I doubt he is
still
doing registrations, anyone know more?

This is nobodies fault except Future Publishing's. As soon as they bought out
ST Review the doubled the rates because they were the only mag, now with Atari
World in the shops and rates a fair bit lower STF are shooting themselves in
the foot.

>On the plus side, there was much more space for articles and I

2152. Phantom mouse button!

Newsgroup: comp.sys.atari.st
Date: 1995-08-13 00:00:00 UTC
From: Dennis McGuire <mcguired@moose.erie.net>
Message-ID: <Pine.LNX.3.91.950813212602.11765B-100000@moose.erie.net>
Source record: 160805

I have a Mega STe which seems to be possessed. It seems to be getting random right mouse button clicks. When I'm running the STorm terminal program, it switches randomly back and forth between the terminal screen and capture buffer. I suspected the mouse, but with the mouse disconnected it still does it although at a slower rate. I'd appreciate suggestions on where to look to correct this problem or feedback from anyone else who has encountered it!

>that or do you have to compile the sources and make your own binaries?
>Is there an ftp-site that holds all that you need for Atari Linux?

Linux/68k kernel source, kernel binaries, release notes, precompiled
binaries, bootstrap programs, X11R6, and prepackaged filesystems
can all be found on the official Linux ftp server 'tsx-11.mit.edu'.

Everything you need to get started can be found on this server.

Also, there is a WWW page for Linux/68k support (which, of course,
I don't remember the address for ;) which you can seek out.

I'm running Linux/68k 0.9.9 on an Atari Falcon030 4/80 with TOS 4.04
with FPU and two external SCSI mechs. It's too bad my Falcon is one
with the SCSI timing problems :(, but it works well most of the time.
As a matter of fact, I'm typing this to you through Minicom 1.60
under Linux/68k with the newly implemented SCC serial driver for the
Falcon modem port. It's pretty damned cool. :)

If you have any other questions please feel free.........

2155. TAF-X-MiNT: questions and complaints

Newsgroup: comp.sys.atari.st
Date: 1995-08-13 00:00:00 UTC
From: contacts@mini.mits.mdata.fi
Message-ID: <40krsf$q8l@news.mdata.fi>
Source record: 160808

My problem:

There's a SLIP (SLIRP) service in my host (via BBS-system/UNIX),
and I would like to use the Chimera with that. Problem is that
I have to use Connect to enter BBS and start SLIRP.
How do I get Chimera detect the open line (It doesn't)?

The BBS tells the addresses are like this, after staring SLIRP:

IP address of SLiRP host: 192.89.182.1
IP address of your DNS(s): 192.89.182.2, 192.98.43.2
Your address is 10.0.2.15
(or anything else you want)

...Where (in what files) files do I put these in X-Mint?
How do I tell Chimera to use SLIP-connection, and not PPP?

PS. It still seems to me that doing a WWW-connection under
MultiTos is the only proper way to get a decent WWW system
done before year 2000. This X-MiNT is slow, and very difficult to
set up (where's the dialog for IP's etc??), usin vi is like going
back to Spectrum, plus the long
filenames force you to use a disk (partition) that does not
operate the rest of the system - A high cost for just
wanting to see WWW-graphics.
But the main flaw is that a proper WWW system needs graphics
space and colour: I can run MultiTOS/HTML in my normal 960*640/16
resolution, and X-MiNT puts me right back to the start (1987):
640*400/2.

Multitos is here, AES 4.1 is here, Alexander Clauss' HTML
reader is here - why X-windows in B/W is what we get?

Two mice of different species and a track ball all exhibit this often annoying behaviour. Does anyone know why - and better still - how to fix it. The mouse pointer usually moves horizontally across the screen unaided. There is not much inside the mouse. I would be interested to know if this is common to other people (or less seriously) - if it is all the cats I keep!

Alittle off topic, but I'd like more info on the Syquest problem!
>Does anyone else know about this? I was hoping it might be a marvellous
>replacement for the bad Syquest 270 removables (I am on to my 3rd
>replacement) and recording D2D with the Falcon...

I have a Syquest 105M removable and have been having trouble getting
my STe to recognized the drives? Is this consistent with the trouble that
you had? It seems that the Syquest comes up to speed the light blinks like normal
but the typewriter like noise it makes when it comes up normally is sometimes
missing! When this happens, I either get no drives active and boot off A
or it will boot off my old Seagate St296N 85M and when I use IDCHECK, it
either say unrecognized device or doesn't see the drive at all! Thought my
ICD adscsi+ was biting out! I was just about to switch to a spare advantageST
that I have laying around to check if it was the host adapter or one of the
drives.

2161. Dallas Atari show (repost)

Newsgroup: comp.sys.atari.st
Date: 1995-08-13 00:00:00 UTC
From: sirsmedley@delphi.com
Message-ID: <JjACSF9.sirsmedley@delphi.com>
Source record: 160814

For those who missed it, or who just need to be reminded, here are the details on this October's Atari show in Dallas.

The Atari Users of North Texas Computer Exposition

The Atari Users of North Texas (AUNT) presents the D/FW Exchange Underground Computer Exposition (DEUCE). The show will be held in Dallas this October in conjunction with the monthly DFW XChange Corporation "Super Saturday" activities at the beautiful Dallas Infomart. Show date is Saturday, October 7th. The exposition, along with the Super Saturday activities, is free and open to the general public. The one day exposition will begin at 8:30 AM and run until 4:00 PM. Both a Friday evening pre-show get together and a post show get together are also being planned.

October is a great time to visit the Dallas/Fort Worth Metroplex. For one thing we probably have better weather in October than most of the rest of the world. The DFW Xchange Corporation "Super Saturday" activities are a monthly computer extravaganza where thousands of computer enthusiast get together, share their computer interests and enjoy some of the best computer and high-tech electronic buys in Texas. This October will be special for us Atarians because many of our finest developers and dealers will be participating in the activities.

The Dallas Infomart facility - a replica of the famous 1895 World Fair Crystal Palace - is located in the heart of the Dallas Market District. The facility is leased by the DFW Xchange Corporation each month to provide a community service to all computer users in the Metroplex area. The Atari Users of North Texas is one of many participating user groups that help support this community service by sharing our Atari computer interests, general computer expertise and providing user assistance to our local Atarians and the interested general public.

Vendors currently planning on participating include; It's All Relative, Systems for Tomorrow, chroMagic, Crawly Crypt Corporation, Oregon Research, Dave Munsie, DMJ software and Branch Always Software.

Vendors interested in participating can contact:
David Acklam
(214) 242-9655
GEnie ..... D.ACKLAM
Internet .... d.acklam@genie.geis.com.

-=-

AUNT will be publishing a smallformat (8.5 X 5.5) Program Guide for the DEUCE show. The main purpose will be to provide ad space for

Atarirelated product dealers and software publishers. Due to the rules of the D/FW XChange, these ads will be AUNT's only source of income from the show. You need not be a show participant to advertise in the Guide, any Atarirelated advertising or advertising from companies marketting Atari products will be accepted.

All ads will be monochrome (black & white). The advertising rates will be the same per square inch as the new lower rates charged for ads in our monthly newsletter AUNT BYTES:

11 X 8.5 double page $12.00 US
5.5 X 8.5 single page $7.00 US
5.5 X 4.25 half page $4.00 US

Pages will have .25" margins all around, but doublepage ads need not allow for a center margin. Ad copy can be submitted "camera ready" for pasteup or in a number of digital formats including:

Calamus(1.09, SL, NT) PageStream

1st Word, 1st Word+, Word Writer ASCII Text
RTF (AtariWorks or ANSI) WordPerfect

IMG GIF TIFF IFF
BMP CVG GEM EPS
PI[1-3] PC[1-3, X, D] PNT MAC
NEO TN[1-3] TGA AIM
RAW ???

Aw heck, just send whatever you have; somebody down here will be able to do something with it to make you look good.

Send it (hardcopy, 720K or 1.44MB floppy] to:

John L. Battey
717 Juniper Ln.
Lewisville, TX 75067283517
USA

or electronically to:

GEnie GEMail J.BATTEY1
Internet j.battey@genie.geis.com
or j.battey@genie.com
AUNT BBS [2144469733] J. L. Battey

If you are inclined to data compression, use any compression technique that seems safe to you. If I can't decompress it, I'm sure our Sysop can.

John L. Battey

Yes, it has happened to me as well. I bought a new mouse in hope of
getting a better one than the Atari mouse, but I was wrong.
This piece of garbage keeps running away on it's own...

You can fix it by trying to align the infrared LED and reciever on
each side (X and Y axis), this usually helps, but it hasn't
helped me....
Good luck!

: The Jaguar is a renamed Panther...

Not quite; the Panther was originally being designed as a 32-bit game
system. When Flare2 showed up with their chipset, Atari decided to work
on that, too. As it turned out, the Jaguar was advancing much quicker
than the Panther, and the Panther was dropped in favour of the 64-bit
Jaguar. (It would have been counterproductive to release a 32-bit system
after a 64-bit system)

From memory:

comp.sys.atari.announce
comp.sys.atari.st
comp.sys.atari.st.tech
comp.sys.atari.advocasy (Fringe, with more flamewars than anything)
comp.sys.atari.programmer

There are other mostly dead ones (like abg.atari.st) on fringe networks.

Other Atari newsgroups:

alt.jaguar
alt.2600
rec.games.video.atari
rec.games.video.2600
rec.games.video.classic (arguable; lots of 2600 buffs though)

There's also the Jaguar mailing list.

I just picked up a brand new game ("Substation") and a fairly new game ("Obsession") for my Mega STe. These games are very impressive graphically, and will work only on STe and Falcon computers (I don't know about TT computers).
Both games are put out by Unique Development of Sweden. It's nice to see that new stuff is still being developed for Atari computers. Does anyone know of any other good, new games available for my Mega STe? A lot of excellent "classic" ST games and software won't work on Mega STe computers (!!!).

Hi,

I need to get rid of some of my Atari stuff...

Atari ST w/ 1 meg of RAM
1 external 720 k floppy drive
1 external 720k floppy drive (not working)
2 bare 720k floppy drives (taken out from an old laptop)
14" Thomson color monitor (works with atari - cable included, vcr
but no speaker and on/off button is gone, other wise
works very well, no screen burn)
Computer Eye color video digitizer catridge(no software)
1 external 5 1/2" IB floppy drive
Non working Atari Mega Ste (no ram, not working - propably
fried TOS chips), w/ scsi hard disk controller but
no hard disk)
And a few games.

$200 firm + shipping + COD

thanks

I want to "surf" the net with my Atari computer. I realize that, to date, no web browsing software is available that allows Atari to see graphics, but it is possible to see text only. Can I do this by subscribing to CompuServe?

I currently subcribe to America On-Line (which has my local newspaper, the San Jose Mercury News, on line). In order to get AOL, I have to be in Macintosh mode using Spectre GCR, because you must use AOL's modem software, which is available only for Macs and PCs. Unfortunately, I can't cruise the Net on AOL with my Atari emulating a Mac. It just won't work.

I have been told that I can subscribe to CompuServe on my Atari using my own Flash software. Does anyone subscribe to CompuServe using an Atari Computer, and if so, are you able to cruise the Net?

Does GEnie have any net service yet? When I quit GEnie three years ago, it was very archaic, difficult to use, and pretty boring all around. Has GEnie improved any over the last few years, or does it still "suck?" I read an article recently that GEnie (the "official Atari on line service") is dying. True?

] Then I get wielrd thought, how expensive would an ST based around
] the Jaguar chipset be---I mean the Jag has a 68000, Tom, Jerry and
] a 64 bit data bus (etc), so couldn't it be programmed with a TOS like
] OS, be rehoused gived a couple of peripherals and be turned in to a
] very powerful low cost home computer?

It was going to be done at one time. But Atari changed their minds, such a machine will never be seen. (Not from Atari anyway). The way they're going, I'll be surprised for them to still exist by the turn of the century. It's either Messy-Dos/Windoze or Mac machines, or nothing, both of which are not as nice IMO as my good ole' ST... (Although, more speed, better resolution and more up to date software would be nice :)

Jimmy was giving a lot of them away, almost eliminating the need to sell such a high end system. (Remember, it was going for around $10,000 a unit). Atari finally pushed him to do the low cost end user system that was supposed to allow the users to play along with just about any recording out there that had "Hotz Code" on the albums. He never got that done, and Atari was starting to re-think their whole involvement in the project. One of the big kickers was that it was supposed to be so easy to use the Hotz Box, but damn near all I heard him play was Stairway to Heaven. :-(

The ST Book was sold in Germany, and a few in Canada. The lack of upgradability really hurt the machine. Neat units though. The one meg unit probably never should have been built, as it really limited what many of the people that were interested/REALLY READY TO BUY wanted to do with the system. Also, there was a demand for a docking type of system, but Atari didn't want to do that. Instead, they produced a software program kind of like laplink to transfer the files around.

2179. Kurzweil Librarian/Editor Programme

K Edit and Object Mover are two Librarian programmes for the Kurzweil. I am trying to find them. Can anyone help me? I don't know what range of Kurzweil Synthesizers they cover, but I have the PX 1000 module.

Kurzweil have told me that K Edit is no longer supported and Object Mover is not on Internet yet. Also, if anyone out there has worked with SYSEX (from the 60 page booklet on the subject), then please contact me.

Any info at all would much appreciated.

My friend turned his Falcon off while it was in the middle of playing an animation using the demo of Apex Media. Now, any programme that uses the DSP will not run. He has written a programme to unlock the DSP using the appropriate call, but it will not unlock. Now his Falcon is unusable for many applications. He has been told the problem is with the static ram chips. Can anyone explain how simply turning the computer off like he did, could have damaged anything, and what is the remedy?

Yep. Use NOS V0.42, I use it all the time. You can get it from the Atari Archive either in all it's separate parts-software, newsreader etc or as the startup110.tos or something like that. Also get Oasis as it is a bit tricky to get working on some machines but is well worth it. The current versions are always held at ftp.demon.co.uk but the archive is nearest to you.

It was none other than Dr Simon G.K. Williams who did write on 12 Aug 95 that
...
DSGKW> I'm looking for a good quality colour digitiser to use on the Atari
DSGKW> TT. I've already got Videomaster, but the quality is crap (16 grey
DSGKW> levels at 320*200), I wonder if Vidi12 st would work on a TT, I've
DSGKW> heard it has problems with the cartridge port. So far, my only

I have used a VIDI12 on a Falcon and it didn't have any problems at all with
the cartridge port on that so I would think it stands a good chance of being
okay with the TT aswell but then the Literature I have to say mentions
compatibilty with the ST.STE and Falcon ..ne mention of TT so either they
have forgotten to mention it or there is indeed a problem peculiar to the TT

DSGKW> option appears to be the MatDigi option for my matrix card, that
DSGKW> does 24-bit in hi-rez but it's very expensive. Has anyone tried the
DSGKW> colour splitter (RGB) for the videomaster, and if so is it any
DSGKW> good? At the moment it seems cheaper to buy a second hand pc and
DSGKW> fit a digi to that!

You can pick up Vidi12 Extermely cheaply recently , I think they were selling
at about 30UKP and it has a built in RGB splitter and I thought the results I
got were pretty good , with the qualification that it dependedly very much on
the Video Quality and lighting !!!

2186. Replay 4 Help Request

Newsgroup: comp.sys.atari.st
Date: 1995-08-13 00:00:00 UTC
From: shinobi@alpha2.csd.uwm.edu
Message-ID: <40jmce$lsu@uwm.edu>
Source record: 160897

I've had Microdeal's (Michtron's) Replay 4 sampling hardware/software sampling package for quite some time, and recently started fiddling with the MIDI features. Supposedly, you are able to sample and specify up to 10 preset samples, and then trigger them with a MIDI device. I can get that to work, but the computer can't tell how large the samples are and assigns the full sample space to each one (319000 something bytes). If you have more than one sample loaded, it will play all of them in a row, even though you have assigned them different MIDI note numbers(using different pads on my drum machine). For reference, I am using a 520STfm with TOS 1.6, (I think), and the Replay software is version 4.3. If anyone could provide me with some assistance, it would be appreciated. Please reply to e-mail. Also, if anyone could give me Microdeal/Michtron's e-mail address (if they still exist) it would be appreciated also. Thank you.

A friend has asked me to get him a basic midi set-up...

From what I understand, a 1040SE, it's mouse, the 720floppy built in, 1M, and the midi cables will do. The only monitor wanted would be the high-res B/W one...

Any other variant, with the same basic features will be considered...but no 8-bit stuff please... Similarly, do not need any other monitors than the H/R B/W

Now.. if you got, and can sell cheaper than it will cost me to scrounge up a hard drive-less Mac Plus, and a $40 midi box, I want to hear from you...

I'm looking for a Canadian seller, because shipping and exchange will add %50 to the cost, making the Mac or (gasp) a dumpster-built 386-with-sound-blaster-clone a better idea...

Just looking for a midi banger, izzall..

Simon, I use the splitter on my Falcon. When you "click" capture
you see the software scan the signal three times (R,G,B). The total
time is approxmately 10 seconds. On the Falcon, using a camera, the
quality is very good. Grabbing from video tape is much less pleasing.
There are connectors that tie into the printer and game port. There
is blackness and color control available in addition to the V/M cart
device controls.

2196. [Q] How do you unstick the HD shaft once and for all.

Newsgroup: comp.sys.atari.st
Date: 1995-08-14 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <40mkvu$jeg@status.gen.nz>
Source record: 160754

I have used 3 Hard Drives that have had the platter shaft finally seize up
One is a JVC 40meg 2 1/2" and two Seagate STN 157.

I am easily able to get the Seagates going again with a quick free up
with a pair of narrow nose pliers on the shaft. I know this sounds crude
but the drive has no problems otherwise. The JVC 2 1/2" drive has the
shaft internally encased. We have to take the lid off the drive to and
very carefully move the platter by a push with a pen, again crude but
we have been doing this for a couple of years now. The drives work
absolutely fine otherwise.

The shafts get stuck very firmly and just need a little nudge to free up.

Has anyone come up with an answer to freeing up the shafts permanently?

```
Network ST International Association (NeST).
=============================================

Press Release Issue 011 (15/07/95)

What is NeST?

NeST (Network ST) is an international network based on FidoNet technology,
dedicated to the Atari range of computers, in particular the Atari ST, TT
and Falcon. The aim of the network is to provide messaging facilities to
all Atari users the world over who are interested in the world of
communications and in the ST. Eventually it is planned that NeST will
extend to virtually every country in the world, however NeST now links the
following countries:

United Kingdom
Canada
The United States
Germany
The Netherlands
Australasia
Italy
France
Spain
Sweden
Czech Republic
Poland
Norway
Denmark
Luxembourg
South East Asia
Belgium

This is by far the largest Atari dedicated network in the world, and it is
growing rapidly, with an average of a new country coming online every
couple of months.

NeST members work closely together to generate a good atmosphere; within
NeST you will not find any political battles, something which can't be
said for a lot of other alternets. NeST also has a habit of collecting
programers from every walk of life, including some very well known names,
who are either members of the network itself, or affiliated with it.

NeST has a wealth of message and file echos, ninety percent of which are
echo'd round the world, and replies can be achieved within three to four
days. The message echo's cover a terrific range, running from software
```

support (ACS, LED, JEKYLL, JetMail, MakeDiff, etc), programing (GFA, C, assembler etc), and general interest echo's like the common room where chaos rules, and users let off steam, and the Q&A echo where weird and wonderful queries are posted.

Or if you are looking for something a little different why not take an interest in Space Empire Elite? The game runs throughout the network, using special programs coded by NeST members to coordinate and send inter-BBS attacks through the network.

NeST allows the use of almost any mailing software, be it F-Net/Crossnet, or fidonet technology, to be used to collect mail, giving a very flexible system of mailing. Point systems are given rights too, if they take a 'Pvt' address in the master NeSTList, they are allowed full participation in the network, including taking part in votes on major changes within the network,again this is rarely allowed in other networks.

One item that worries some users, and sysops is cost, that is network fees for linking into the network itself. With NeST no such fees exist, as each member works freely to gain the best connections, minimising mail costs as much as possible.

If you want to join a network that's friendly, fun, well informed, and concious of what's going on, well why not try NeST, I don't think you'll regret it!

Hi everyone,
I've just entered the world of MIDI and the only thing preventing me from becoming a drum and bass superstar:) is my cruddy sequencer. Will Cubase 2.0(Audio? 3.0? Pro?) run on an Atari 520 ST with 1meg and a single sided drive? And if so, do any of you have a copy you'd be willing to part with?

All praises,
geoff

> useful in terms of instructions. Any help would be greatly appreciated.

there is an distribution of Linux68k here in germany by Whiteline Soft. It
is available on Floppy-Disk an on CD-ROM. The other way is to get it with
ftp, for example from tsx-11.mit.edu, they have a 680x0 tree in their linux
directory.

First you need a precompiled kernel, a bootstrapper and a ramdisk filesystem.
Mostly you get all the things you'll need first in the getting_started
directory. In the doc directory you can get an FAQ, so you can get further
with it.

An other source of information are the two Linux-68k mailling-lists, one in
germany at phil.uni-sb.de (mail to majordomo) and the other at
vger.rutgers.edu (mail to majordomo).

You could try to call logitech. I had them on the phone just a couple of days ago and they said they themselves had atari-mouses in stock.
If you need the number, just mail back (holland number though). The number nearest to you will be in Logitech documentation. If you don't have these yourself just visit a shop ;)

Hi there,

I was thinking if anybody outthere got their copy of STARDUST ??

I just got mine a few days ago, and it's GREAT !!!!

I got it from a dealer here in Denmark, that imported it from
Daze Markerting in the UK. I've heard that some people ordered
it thru ST Format, and that they haven't got it yet. But I thought
since my copy did arrive (with a 2 month delay)
- I was wondering if all the other people who ordered it
has got a copy now ??

The graphics in STARDUST are BRILLIANT, the sound is COOL and
the game is EXTREMELY ADDICTIVE !!!!

Keep Cool and Flying...

No, it is not. The Panther is the abandonned 32-bit console from Atari.
Is was dropped because the Jaguar was almost finished at the time, and
the Jag is a 64-bit machine - ya know.

Source record: 160768

I have the following item for sale. I have not used them for quite some
time, so they are just sitting around collecting dust:

Individual Price
1. Atari MegaSTE System ($400)
- 16 mHz 68000 CPU
- 4 Megs RAM
- TOS 2.06
- 1.44 Meg Floppy
- External Keyboard
SC1224 Color Monitor ($85)

Whole System for $450.

2. Spectre GCR 3.0
All original software included
All Mac disks I have
PRICE: $150, shipping included

3. PC Ditto II
All original software & hardware & manuals
I got this to work once, but then I switched to a Mega STE so I
cannot use this board. I cannot guarentee it works.
PRICE: $50, you pay shipping

The Atari can't read Mac disks but it can read MSDOS compatible DD disks, so you have to put your file on such a disk.

First, you must get back to a Macintosh computer. It should have System 7.5 installed (if not, it should have PC Access, PC Exchange or DOS Mounter installed).
Initialize a new disk (double density, not HD!) on the Mac with MSDOS-format (put in either a non-formatted disk or choose "Erase Disk..." from the Special menu). Copy your MIDI file on it. If your file is larger than about 710KB, you should compact it first using a ZIP or LHZ compression utility on the Mac.

If you need more help doing this, write me an e-mail.

Thomas

AFAIK, this ISO char set is a 8 bit code and is used also by the Amiga OS
and Windows.
So all you have to do is to find a tool that can convert Amiga or Windows
text files. Blinex could be such a program but don't ask me where to get
it.

Currently, MagiCMac does not support the archive bit on drives that are located on Macintosh volumes. If you connect a SCSI disk to the Macintosh that was partitioned on an Atari (AHDI compatible), archive bits are supported.

Archive bits are on the TODO list but it may take some more weeks...

Linux does run on a TT - I can testify to that. My son ran Linux
demos at MIST VII, the show at Indianapolis about 2 weeks ago. He
has found some binaries available for the 68000 and they usually work
- other times he grabs sources (Tcl/Tk) and compiles them and then
they work. Many times they require no changes. Occassionally they
will bump up against some capability that the Atari port of Linux
hasn't included yet (a driver for one of our more "exotic" ports
or pieces of hardware) but Linux seems to be getting better and
better with each release.

Jonathan had Linux up and running for the 5 hours of the show. We
tried PPP this weekend but we think we are missing some setting and
didn't have enough time to pursue it then. Expect to have it up by
this coming weekend. We have run Chimera on Linux. Wayne

Excellent suggestion. Unfortunately, this doesn't work with all games and soft
ware, because I've tried it. My friendly local dealer (one of the last in the
U.S.) has a strict no return policy. Once you buy it, it's yours, whether or n
ot it works on your computer. So -- What I need is a reliable list of stuff th
at will and will not work on a Mega STe. Does list that reliably gives the com
patibility of software and the various types of Atari computers (ST, Mega ST,
STe, Mega STe, TT, and Falcon) exist? It would have been nice if good old Atar
i had paid more attention to making sure that their different computer models
were a bit more compatible, eh? --Mark van Wyk

The Aug'93 issue of Atari ST Review mentions a program similar to 3D construction set called "RAMWORLD 2". Anyone know where to find this? And: What the heck is 3D construction set?

2227. UK National Lottery Companion 2 program available

Newsgroup: comp.sys.atari.st
Date: 1995-08-14 00:00:00 UTC
From: Mark Butler <Mark@dwell.demon.co.uk>
Message-ID: <530946332wnr@dwell.demon.co.uk>
Source record: 160785

Following on from Lottery Companion 1 which achieved 60% in ST Format, Lottery Companion 2 is now available.

The program is arguably the most powerful and comprehensive National Lottery Program available for the Atari range of computers, and even runs on the Falcon.

Complete UK statistics including Ball Set, Draw Machine, Draw Order and Date of Draw are included.

It uses a friendly combination of Windows, Drop-down menu's and Resource fields and buttons on top of a powerful number generation and statistical engine.

Random, Manual, Range, Hot, Cold, and Wheel with 0 to 5 Bankers can be used to select over 7000 number sets per file. you can have as data files as you like with personal or syndicate number sets.

The program is Shareware with Registration and six months Support from as little as five pounds.

But why not look for yourself? - Message a request for a copy of the program personally to me, and I'll be happy to mail it back in UUE format.

Alternatively send a Disc and S.A.E. to LC2, 8 Brookside, LE10 2TL.

Note: This is not a ruse to add your name to a mailing list, I am an independent Shareware author who has been writing for the Atari 16/32 bit range since 1988. I will only contact you again if invited to do so.

It's great to see such a thriving Atari community of the NET, and I look forward to becoming involved in the many On-Line discussions.

I hope to hear from you soon.

Hello!? McFly?! Anybody home!? Think, McFly, Think!

C-Lab obviously aren't as stupid as Atari, and therefore will obviously
fix the majority of the problems..... Besides, even "two years old", is
still more recent than the latest Falcon-TOS!

2233. Using Hewlet Packard printers on Atari's?

Newsgroup: comp.sys.atari.st
Date: 1995-08-14 00:00:00 UTC
From: msh@mserv1.dl.ac.uk
Message-ID: <40nkoi$2he@mserv1.dl.ac.uk>
Source record: 160791

I'm considering buying a printer later this year and have looked at the
HP 520 and 560 at the low end of the range. Now I have graphical software
that should work with HP printers my question is what about plain word
processors, text editors and DTP programs that have no HP drivers for them.

For the most part I use 1st Word, can anyone comment if this would print
correctly without a HP printer, with perhaps a Epson or IBM printer driver?
Also for text editing I use editors such as Edith and Everest. Can these
print plain ASCII with out the need for any special drivers?

What about programs like "That's Write", "Calligrapher" and "Timeworks 1"?
I know these tools are fairly dated and primitive but before I spend money
on a HP printer and sell my 24pin Star (which works with these okay), I need
to know if I will be able to print plain and specially formatted documents
using these on my Atari.

Has anyone got any experience or can anyone advise me? Thanks in advance and
please contact me directly by email.

TW3, Callig and most other word processors will work just fine with an HP DeskJet. If you use a GDOS-based WP, you'll have no trouble at all; HP DJ drivers are all over the place. If you use a non-GDOS WP, you can use any of a dozen or more freeware or shareware ACCs and/or CPXes that let you control the DJ from within any program. Plus, DJ drivers have been written for most of the older WPs. My DJ works with everything, and, since I write for a living and have a fascination with word processors (and therefore tend to collect them), that's a pretty good endorsement of an HP DJ for use with an Atari.

>Thanks for your help.
Not a lot that you can do really except remove the host adaptor from the
megafile and use it as a bare SCSI device. Does the Megafile have In & Out
ports? If so chuck the link away for a bit and just cahain it through. I hight
be wrong about all of this as I ahve never used Megafiles as I hate thge
things! No offence.

>Which kernel are you using?

Dunno. Sometimes it hangs during the fsck step in the boot and during
heavy disk access, but most of the time it's OK. I guess patience
is the key word here! :)

I'm simply using the precompiled version of 0.9.9 on tsx-11. It's very
large, but it works well so far. I'm going to try my hand with PPP
very soon.......this stuff kicks my *ss! Very nice work by the
programmer community at large.

BTW, sorry this stuff isn't coming out spaced correctly. I don't know
if it's because DELPHI sucks or what, but my messages are definitely
not formatted the same way I'm seeing them before they're posted.

Hello android LERWICK! The 12.08.95 you talked about "NVDI vs Warp9",and my reply is:

> If your looking for maximum speed, go with NVDI.
>

Nope.. Thats not true..

We have just had this discussion here in Sweden, and i proved that on a clean ordinary STE with TOS 1.62 a Gembench test with Warp9 (v3.80) gave 246% in Medium Resolution. And NVDI (v3.02) gave only 223%. So your statement is wrong.

Warp is faster.

If you dont bealive me i will include the test results.

Try it for yourself and see.

> So where is it possible to get your hands on an ATW and how much does it cost
> these days? Just curious - might want to have one and solder it onto my M4STe
> or something. ;^)

I bought one on a Computer Show here in Dortmund a few month ago. A dutch
vendor sold the collected rest of former european Atari departments. I payed
DM 150.-- for it, that are about $110. It came without harddisk and keyboard.

The ATW800 is divided in to parts, the T800 Transputerboard and an IO-Host,
a Mega-ST-like board. Because the tower-case is very nice and stable, I plugged
my PAK3 on it, added a Quantum ELS 85 and a Quantum Lightning 540, installed
Linux68k and I am happy that I made that good deal :-)).

This is pretty odd as an ST will boot quite happily without a floppy or
hard disk. AFAIK it never asks for a disk - unless you have the original
16K boot ROMs - which you would know if you did.

It is possible though for a corrupt hard disk to interfere with the
operation of the floppy. I had this with my original TCT hard disk.

To cure it I did:

Boot from floppy with the hard disk off.
Load the boot software (ICDBOOT in my case) into a RAM disk.
Turn the hard disk on.
Run the boot software from the RAM disk.

This gave me back control of the drive so I could then replace the autoboot
software on it.

Its risky however as it could blow your DMA chip. Unlikely - but it could
happen. OTOH it might be blown anyway. This might account for why the hard
disk is interfering with the floppy anyway.

:-)

Roland.

The VIDIST12 *software* works on the TT at least - though it doesn't know
about TT video modes though. I haven't had the guts yet to actually plug
the cartridge into my TT yet. Its currently residing in my STM.

> mention of TT so either they have forgotten to mention it or there
> is indeed a problem peculiar to the TT

I wondered about this too.

> You can pick up Vidi12 Extermely cheaply recently , I think they were
> selling at about 30UKP and it has a built in RGB splitter and I

1st Computer Centre (0113 2319444) still appear to be selling them at 69.99ukp.
They can be picked up 2nd hand for 30-40ukp however.

> thought the results I got were pretty good , with the qualification
> that it dependedly very much on the Video Quality and lighting !!!

I was pretty impressed with the results too. Live grabs from my Panasonic
VHS-C camcorder were very good - as was freeze frame from my Panasonic VHS
VCR.

Totally useless for any sort of moving image - except stop frame animation,
which is what I intend to use it for anyway.

:-)

Roland.

2249. [Q] RGB monitor in TC on Falcon gets bands

Newsgroup: comp.sys.atari.st
Date: 1995-08-14 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <40m3vj$5pv@status.gen.nz>
Source record: 160843

We have a ST RGB monitor which we have been using on our Falcon030.

It works perfectly in any number of colours up to 256, but in TrueColour mode bands appear between two pixels next to each other horizontally when one has an odd green shade and one has an even green shade. When they both have even or both have odd shades of green, there is no band between them. The bands do not occur when the two pixels are above or below one another.

Each band appears to be about the width of a single pixel. The bands are a very dark shade of the colour of the two pixels which the band is next to.

This makes a horrible effect when one uses a gradient fill from one colour to another when one or both of those colours contain some green. Since a lot of colours contain green, this makes it impossible to use the Falcon030 for this sort of thing. Of course the bands are not actually saved with the picture, they are generated by the monitor. The same picture that looks bad on the RGB monitor looks fine when viewed on a VGA monitor (or another RGB monitor).

We have obtained another RGB monitor, and the bands do not occur on this monitor, so the problem is with the monitor.

Is it just a matter of adjusting the monitor, and if so, how can this be done.

Any help with this problem would be much appreciated.

2250. [Q] True Greyscale Scanner Available?

Newsgroup: comp.sys.atari.st
Date: 1995-08-14 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <40m4vj$5pv@status.gen.nz>
Source record: 160844

I have seen a 256 Greyscale Scanner advertised some time ago in an English Atari magazine. I wonder if this or something similar is still available.

There are many "Greyscale" scanners which only save a Black&White image, but simulate greyscales with dithering. I am thinking of a Scanner which can actually save a greyscale image (i.e. a TIFF file or whatever).

If someone is thinking of selling such a scanner, please get in touch.

Or is there a way the common Black&White dithering scanners can be altered to produce "True Greyscales"? Is the scanner head actually producing greyscales, and the software is dithering it (in which case it would be a matter of replacing the software) or is the dithering generated by the scanning head?

There are programmes which can convert a dithered image file into a greyscale, but the ones I have tried didn't produce very good results. If anyone using software which does a good job, please let us know.

I know the antiquated IMG Scan "Printer Scanner" could do this, but it is not a realistic tool to use, as the results are very variable.

Thanks very much for any help.

It was none other than Spencer Davies who did write on 13 Aug 95 that ....
SS>> Note: Under MultiTOS things work fine, but with the AES 4.1 kernel
SS>> I also get the `mouse droppings' sometimes. It's not relaxing to
SS>> work in the lower part of the screen when the system can freeze up
SS>> any time...
SD> Hmmm, when using 4.1 I don't recall getting any mouse droppings? I
SD> will have
SD> to reinstall Multitos and give it a proper test.

The symtoms he describes are the result of using a version of Mint that has
been compiled without MULTITOS and with FASTTEXT flags.
I beleive all the freemint binaries disctibutions are so compiled and have to
be recompiled to work with GEM AES correctly.

2252. [Q] ICD Link - chaining onto other ACSI devices

Newsgroup: comp.sys.atari.st
Date: 1995-08-14 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <40m553$5pv@status.gen.nz>
Source record: 160846

I have been using the ICD Link 2 to access a SCSI drive on my ST. It works perfectly on it's own, however I have been unable to chain it onto another ACSI device (Megafile 30.)

Do I need to change the ID of the Megafile 30, and if so, how can this be done?

Thanks for your help.

2253. Atari Ghostscript 3.33 Available

Newsgroup: comp.sys.atari.st
Date: 1995-08-14 00:00:00 UTC
From: "Timothy E. Gallivan" <timg>
Message-ID: <40man8$moe@news1.is.net>
Source record: 160847

Hi all,

After much delay (I had good reason :-), I have made source and
executables for Atari Ghostscript 3.33 available for ftp from:

ftp://lifshitz.ph.utexas.edu/pub/atari/ghostscript/3.33/gs333b.zoo
" /gs333s.zoo

New features since 3.12 include the return of working color (I hope)
and the ability to read and display documents in Adobe PDF format
(this part is somewhat buggy).

The Atari Ghostscript WWW page is a bit outdated now, but these files
can also be accessed through links found there:

http://godel.ph.utexas.edu/Members/timg/gs.html

I can find little time nowdays to work on GS, so please read the docs
before sending me questions.

Regards,

Tim Gallivan

Hmm, I'm a Warp9 user myself. I've never used NVDI, nor I know anyone with it.
But according to "the word on the street", NVDI is faster. And a review of NVDI
in ST Review, NVDI was faster than Warp9 on a Falcon. Oh well.

[snip again]

I vaguely recall seeing a review or article about a program called
Midigrid which did something similar. I think it allowed you to put
short sequences into a grid on screen which played when you clicked
the appropriate square.

Mail me if this sounds like it might do the job and I'll see if I can
dig up anything about it.

2268. Atari Networking Guide (TCPIP.FAQ)

Newsgroup: comp.sys.atari.st
Date: 1995-08-15 00:00:00 UTC
From: baldrick@terminator.rs.itd.umich.edu
Message-ID: <40q78p$nqe@lastactionhero.rs.itd.umich.edu>
Source record: 160662

The August 15th version of the Atari Guide to Network
Connectivity has been placed on atari.archive.umich.edu under
Info/tcpip.zip. It's much larger that the old version. You might notice
while perusing it that it seems to be a work in progress. Well it is.
The last few months have been extremely busy and I'm slowly getting some
free time opening back up. Why mention this? Well since I've been so
busy this release is actually more that a month later than I had
planned. I decided that instead of just letting rot on my harddrive I
would send it out. As I have included lots of new information. So
please excuse how out of date some sections are and if a section seems
only half edited.

New info included (at least to some extent):

Linux
Xwindows
More MiNT Net info
expanded local networking info
More NOS info
plus lots of litle additions here and there throughout the document.

I haven't sent it up to the group as the new version is over 100k
in size. And I'm sure someone would play net police if I sent it out.

Now for a few requests. The size and scope of this document has
greatly expanded. In fact I would say it is impossible for one person
to do a good job in all of it's areas. So I am looking to recruit a few
people to help me. So if you have a good knowledge of one of the
areas in the guide and some freetime, please drop me a note.

Dan Ackerman
baldrick@terminator.rs.itd.umich.edu

ps. I would also like to apoligize to some authors. As I stated
this version is actually about 2 months out of date. So some packages
do not appear or only appear in passing. I do intend to rectify this in
latter revisions, some please don't be angry if you don't show up now.

2269. Re: Atari Networking Guide (TCPIP.FAQ)

>And: is there any chance of burning a v2.06 TOS.IMG into some EPROMS, and have
>it work in this 520STfm? (upgradeing from 1.0 to 2.06 without one of those
>special cards)

The _reason_ for needing a 'special card' is that the 2.06 TOS needs 256 KB
whereas the 1.x TOS need 192 KB. And those eproms have 32 pins instead of 28.
So, yes, you can burn TOS 2.06 into eproms, but _no_, you cannot, then, fit
those eproms in your 520. (unless you want to do a lot of soldering or buy
the card you mention)
You did not honestly believe people would design a special card to fit TOS
2.06 in an 'older' ST if there was no need for this card in the first place,
now did you ?

The only answer is to get cracked versions, they contain no protection
and are smaller than their original counterparts due to file compression
by the cracking groups.

Generaly games that dont run on the STE will run when cracked also...

From: gs01tph@panther.Gsu.EDU
Message-ID: <40ptg3$kf5@sphinx.Gsu.EDU>
Source record: 160709

Are there any high quality 24-bit digitizers available for Atari TT today ? Can Expose be used with TT - and if yes, what are the specs (especially: how long does it take to digitize a 16- or 24-bit full-size SVHS picture..? Matrix MatDigi does this 15 seconds - and that's too long for my use..).

Greetings,
TH

It was none other than Kerstin Hoef-Emden who did write on 14 Aug 95 that .... KH> : LDW Power .. LOTUS123 Clone and very good too , you can pick this up
KH> new for about 10 quid if you shop around.
KH> No!-Software is working at LDW3. I have seen a beta-Version of the
KH> programm. It will be distributed by Compo like other No!-Software.
KH> In contrast to LDW2 it runs under multitasking-conditions.

Oh ! Are these "upgrades" from LDW power in the true sense of the word or merely sharing the same name .. I love the nice Clean feel to LDW .
LDW2 already out ? This is astounding news to me !! Compo have never attempted to sell these in the UK AFAIK .. are they tranalsted into English By any chance ?
Hope LDW3 appears in the UK though as I rarely work in Single tasking env anymore so would not really be interested in V2 at this late stage.
What sort of changes apart from that are being made to V3 .. I suppose against V1 even ?

You've probably already thought of this, but try disconnecting your keyboard as well, not just the mouse. This will at least help you isolate the problem to either the CPU or the keyboard. The Mega STe keyboard has its own microprocessor which sends the mouse, joystick, and keyboard signals all through that phone cord. This is how your keyboard can get temporarily scrambled if you boot with a joystick plugged in... it iterferes with the initialization of the keyboard microprocessor. Anyway good luck, if that doesn't work call Toad. By the way I think they also have replacement keyboards for about $40 or so.

Hello,

A friend of mine is currently using an Atari ST 520. He is
using the program DB-master One, for keeping a quite large
database. Now, he's feeling the computer is getting to slow,
and for compatibility reasons, he wants to buy a PC.

Is there someone who knows if there is any conversion possible
from the db-master fileformat to a standard PC database format,
or eventually to ASCII?

When there's no such tool, can somebody explain the db-master
format to me, I can write a tool myself.

Please answer by email, I don't read this group too often.

Thanks in advance,

Rienk.

Paul Womar (paul@pwomar.demon.co.uk) wrote:
: In article <40m553$5pv@status.gen.nz>
: mbecroft@iconz.co.nz (Mario Becroft) said:-
:
: Not a lot that you can do really except remove the host adaptor from the
: megafile and use it as a bare SCSI device. Does the Megafile have In & Out
As the bare drive in the Megafile is not a SCSI device, this is not possible.

To clarify:

The megafile is plugged into the computer's ACSI port. We want to plug
the Link into the Through of the Megafile (and of course the SCSI device
onto the link.)
What happens, is the Link works fine with the SCSI drive attached on it's
own, the Megafile works fine on it's own, but when they are chained as
above they don't work (presumably due to conflicting ids.)

I can't find a way of changing the Link's id, so I guess I have to change
the id of the Megafile. If this is the case, where are the id jumpers
located? And how can the id of the link be changed if necessary?

2287. 'Interactive' sequencers for Atari ST? Help wanted!

Newsgroup: comp.sys.atari.st
Date: 1995-08-15 00:00:00 UTC
From: tkorpi@convex.csc.FI
Message-ID: <40q2gt$bvo@pobox.csc.fi>
Source record: 160720
Cross-posted to: comp.sys.atari.st,comp.music,alt.emusic,rec.music.makers.synth

Could someone recommend a flexible sequencer with real-time-controlling-of-sequences for atari ST? OK, I know KCS Omega II, of course... I just got a letter from Dr.T's music software: Omega II is discontinued from their line of programs. I've had the impression that they are dumping their whole line of atari-programs. I may be able to track a copy of KCS anyway, but I think it may be a little too advanced to my situation. I don't need algorhythmic composition or morphing effects. I just need a program that lets me to compose the 'bricks' and then just to 'build' the wall then playing live. Most computer-sequencers (the ones I've seen) behave like tape-recorders, which is fine, but don't work in what I'm trying to do. I do think that the KCS would be fine to me, but it may be difficult to track it down and I may be trying to open the nut with a sledgehammer. Is there anything simpler with similar options. Actually I don't even own a ST yet, so if you know something similar to Amiga... tell me (Macs and PCs don't fit in to my budget, I'm afraid).

Thanks in advance.

Well, I see BRASOFT has come out with a new version of Gemulator. Version 4.0 works with Windows 95 and is now STe compatible. It looks snazzier and sounds snazzier, but, it still won't read copy protected disks. That means I can't play The Pawn, Dungeon Master, Barbarian, Chaos Strikes Back or any of my other favorites. Does any one know of a way to copy disks over without the protection? Has anyone ever been able to get any of the mentioned games to run on Gemulator, and, if so, how? Any help would be greatly appreciated. Thanks in advance.

Sincerely,
- Byron Followell

>or something. ;^)

ACN in the Netherlands probably still can sell them.
ATW800 system (1 Inmos T800) + keyboard = 599,- guilders
MEGA ST I/O system = 599,-
Farmcard (4 Inmos T800) = 599,0

The MEGA ST board is modified to be able to communicate with a transputer. So
it contains a Morpheus chip (Atari custom DMA chip ??) which controlls the
Inmos C012 comminucation chip, the NCR5380 SCSI chip and some signals for the
diagnostic bus.

You can create some additional hardware to your M4STe to control the
transputers, but that will be quite difficult, I think.

Greetings,
Ids.

2291. SLIP and X for MiNT...

Newsgroup: comp.sys.atari.st
Date: 1995-08-15 00:00:00 UTC
From: gs01tph@panther.Gsu.EDU
Message-ID: <40pue0$kf5@sphinx.Gsu.EDU>
Source record: 160724

Could some of you "gurus" tell me how I make a SLIP-connection with my local university server.. The (otherwise well done) Toronto Atari-user group's X11R6 for MiNT -kit just doesn't give any information about this =-(...

There are lots of people like me around who know practically _nothing_ about UNIX-environment, or transfer protocols. Those info files provided with most GNU-, MiNT-, X-, etc. programs could as well be written with Hebrew... They're just not comprehensible without lots of background knowledge. So, now when more and more people among us will try WWW and other Internet services, something like "How a complete Idiot can make a SLIP -connection" and "An Idiot's Guide to Most Common UN*X Features" !

Thanks for any help =-) !

Tommi (lost in Internet..)

Branch Always is still around. However, Darek moved out of Canada a few years ago and is now in Washington state (or Oregon, can't remember offhand!). QuickST was sold to CodeHead a few years ago also; it was reincarnated as Warp 9 - very nice. Warp 9 can be found at most dealers, I'm sure.

> down the road. The Intel systems won the war (unfortunately) like it or
> not.

Oh come now, Ari. Who are these "all-knowing, all-seeing" pundits of yours that have such a firm grasp of the future? Intel has some 90% of the world marketplace in personal computers, true. But the world is a very large place, indeed. Poor little 'ol Apple, the meager runner-up, sold 1.4 million PowerPC's in the last 12 months and I don't know how many 040 systems. That makes them the world's largest manufacturer of RISC-based systems and they've been the largest personal computer manufacturer for some time. The licensing of their MacOS to third-party vendors will likely increase their market share, over time, as well.

Sure, Apple may -eventually- close its doors and succumb to the Intel & MS giants, but with numbers like these, being #2 ain't all that bad. And as Windoze continues to evolve to make PC's more and more "Mac-like" <cough> we can be glad that little upstart companies like Apple (& Atari) were around to "point the way" to the future. Without them, PC users would still be staring at that durn C:> prompt and asking, "What do I do now?" ;-)

If the price ($45) is right on the 1040st system and it's still
available, then, i'll take it. Send me email and let mer know if that
was the correct price and if it's still available. I'd be happy to pay
shipping and extra for your packing troubles. I tried to send you
email, but, my postmaster kept sending it back as undeliverable.
Something about it couldn't find your server or no such user or
something like that.

Sincerely,
- Byron Followell

I use a Deskjet 520 with First Word Plus amongst others without problems. There are printer drivers available in the public domain for the Deskjet series and the printers themselves come with an IBM proprinter emulation mode.

A "two-for-the-price-of-one" reply...

In a previous article, garnerg@esu.edu (George W Garner) wrote:

> ---> Does anybody know what happened to Branch Always Softwaree, the
> authors of Quick ST II, a great Gem desktop accellerator?

and Christophe Devalland <cdevalla@cominfo.fr> wrote:

> I am looking for an atari ST emulator for PC....
> Where can I find it ?

They (Darek Michoka) are very much in business, but have moved to the US now (his day job is with Microsoft in Washington state). Be advised that Quick ST was sold a loooong time ago to CodeHead Software and has been marketed as Warp 9. Branch Always is probably more famous for the Gemulator ST emulator product for the PC now.

You can reach them at brasoft@genie.geis.com.

Cheers,

-Hutch-

2299. Reading MS-DOS disks with ST: How?

Newsgroup: comp.sys.atari.st

OK, stupid questions part I...

I don't even own a ST yet (trying furiously to buy one, thought), but I would like to know is it possible to read MS-DOS formatted disks with ST. Or is it possible to write atari-format (TOS isn't it?) with PC? I remember reading that the procedure is possible, but how?

Thanks in advance.

Ari,
do you really, in your heart of hearts, believe that the x86 architecture has more than five years left in it? P6 is pushing the boundaries of what is feasible w/ current chip fabrication techniques; unless someone in a lab somewhere has got an X-ray etching system up and running reliably and cheaply, there ain't gonna be a P7. Why do you think Intel are jumping into bed with HP? VLIW technology, that's why. Intel will survive, Microsoft may (unfortunately IMHO) survive, tho' what'll be left of them when the Justice Department's finished, god only knows, but the hegemony of the x86 box running DOS and Windows is drawing to a close. Both are straining to support the apps. that people want to use on their home multimedia peecees; fundamental architectural flaws which, for reasons of 'backwards compatability', Microsoft have repeatedly refused to address mean that any new processor architecture is going to require a new OS to exploit it to any great extent. Yes, NT may do the job (NT on an Alpha is possibly the best MS product since Altair BASIC in terms of bearability) but in the real OS market, NT is just one of a crowd of good OSes - *nices, for all their many and well documented faults, are starting to penetrate, due largely to the success of Linux and the people who have ported the GNU tools to every platform under the sun (and that too :-), QNX seems to be well on the way to becoming a standard in the real-time OS market etc, NeXTstep appears to have won many developers' hearts etc. Hell, even MacOS may take off, and, let's face it, Apple have always been a *very* good marketing company.

No matter what processor does win out in the medium term, be it MIPS, Alpha, POWER, PA-RISC or whatever, the days of the PC as a machine even vaguely close to the cutting edge are numbered. They've basically pushed the old traffic light controller as far as it'll go (puzzled by this last insult? It wasn't an insult - check what the 4004 was originally used for. And what MS were originally called. Coincidence? Or just cosmic patterns. Who knows!)

(and to all the computer/OS bigots out there - you know who you are - remember the following:

1. Just 'cos you own a particular machine doesn't mean that all others are worthless

2. Some of us have been around a *long* time in this game and have seen it all before

and 3. Everything is obsolescent sooner than you know or would wish. Accept it and cope with it.)

(this last wasn't intended as a dig at Ari, who has always appeared to me to be a most reasonable person.)

Hallo Graham and everyone else interested,

Graham Irvine (graham@grasper.demon.co.uk) wrote:

: Oh ! Are these "upgrades" from LDW power in the true sense of the word or
: merely sharing the same name .. I love the nice Clean feel to LDW .

This is a real update/upgrade from LDW.

In the past there has been trouble with the support, the distributors
changed several times. Now No!Software took over the sources.
If you have been registrated you should write to Compo that you are
interested in being informed for an update. Compo did not get any list of
the users by the former distributors: They have been told that the data
got lost!

: LDW2 already out ? This is astounding news to me !! Compo have never
: attempted to sell these in the UK AFAIK .. are they tranalsted into English
: By any chance ?
I cannot say anything about the existance of an English version. LDW2 was
given to a suisse distributor. Like Markt & Technik before they were not
interested in a serious support. Things may now change.
As a matter of fact the dialogues in the beta-version of LDW3 are still a
funny mixture of German and English. I think Compo will release an
English version as well.

: Hope LDW3 appears in the UK though as I rarely work in Single tasking env
: anymore so would not really be interested in V2 at this late stage.
: What sort of changes apart from that are being made to V3 .. I suppose
: against V1 even ?
Until now I did not work seriously with LDW. Just intend to getting
started, but there must have been quite a few changes between V1 and 2.
About LDW3: One of the no!-programmers told me that they increased
the precision of calculations. Another feature, sure, is
multitasking-compatibility (it works under Multi-Tos and MagiC). They
want to change the concept of printing, in using the same drivers they use
for their text software That's Write. And they want both
programmes to work together in exporting data from LDW to That's Write.

I guess they will present it, ready for distribution or not, on the
proTos in Bonn/Hennef in November 25/26th.

Bye,

Kerstin

It was none other than Roland Givan who did write on 15 Aug 95 that ....
RG> graham@grasper.demon.co.uk said:
>> I have used a VIDI12 on a Falcon and it didn't have any problems at
>> all with the cartridge port on that so I would think it stands a
>> good chance of being okay with the TT aswell but then the Literature
RG> The VIDIST12 *software* works on the TT at least - though it doesn't
RG> know about TT video modes though. I haven't had the guts yet to

That is strange as it works IIRC in Falcon Video modes (Including BlowUP ones).
>> mention of TT so either they have forgotten to mention it or there
>> is indeed a problem peculiar to the TT
RG> I wondered about this too.

I can't see it doing any harm to either device to plug it in and trying it ?
But some technical details of any diffs to the pin outs of the cartridge
ports between TT and Other Ataris might be a prudent first step !!
>> You can pick up Vidi12 Extermely cheaply recently , I think they
>> were selling at about 30UKP and it has a built in RGB splitter and I
RG> 1st Computer Centre (0113 2319444) still appear to be selling them at
RG> 69.99ukp. They can be picked up 2nd hand for 30-40ukp however.

Rombo themselves were selling them for 30 UKP at the Last London Atari show ?
Maybe of course a Show special but I think they advertised a similar price in
ST review aswell IIRC.
RG> I was pretty impressed with the results too. Live grabs from my
RG> Panasonic VHS-C camcorder were very good - as was freeze frame from my
RG> Panasonic VHS VCR.

The only problem I had was getting a good contract/brightness balance with
indoor or poorly light video source but the colour and definition was prettyacceptable.

RG> Totally useless for any sort of moving image - except stop frame
RG> animation, which is what I intend to use it for anyway.

Yep if you want to do real time Video grabbing then you need the Expose Board
which is excellent at this sort of thing .

Jon:

Ok. You win. You put up a fair arguement. Perhaps you are right. I have my doubts about the 80x86 architechture as well. It was ugly back in 1985 when I got my PCjr and its still ugly now!

I use a PowerMac at work and have to admit I do like it - but that is more to do with the apps and the OS than the performance of the machine.

Anyway, my arguement was based on many things:

1. What I see happening around me

2. Where I work (multimedia and internet service, etc.)

3. People who I know WHO really know what's going on (i.e. hackers, professional developers, etc.)

There are just so many things going on in the industry right now it just makes one's head spin. Who know what will happen? Maybe in 2 years we'll all be running some dialect of Windoze 97 running on a home version of the DEC Alpha!

I've learned that when you're dealing with the computer market - anything can happen.

Regards,

Ari

I should have let this one pass, since you did say you were just recalling
from memory, but so as not to sully the good name of Atari (uh_huh)....

alt.2600 - is _not_ Atari related, but rather a very, very low signal to
noise newsgroup dedicated to phreaking, hacking and generally
related nonsense - taken from the hackerz magazine of the same
name and originally from the frequency used for certain control
signalling on the telephone switching network

don't mind me... just being picky.

a> to me. Running it under MTOS, I would get unexplained "operating
a> system halted" messages, doing "normal" things I've always done...

seems likely , I continue to use 1.12h2 compiled for use with multiTOS for
this very reason and I get no problems at all running all sundry of stufftogether.

> No color?

The SM124 is used as a ``system console'' -- plain text, 24x80, but with `virtual screens' between which you can flip using Alt-F1. There are also connections for a colour monitor in various modes from 640x480 x256 (VGA) to 1280x960x16. In principle you only need the SM124 to get things set up, once you have X running on the colour monitor you can throw the SM124 away.

Unfortunately I haven't yet got my cheap SVGA multisync to work with any of the ATW video modes, despite fiddling with sync widths and who knows what. :(

>
> 'I can't forget...
> but I don't remember what'
> -Leonard Cohen-

Atari ST's can read DOS double density (720K) disks MOST of the time.
Mega STe's, TT's & Falcons or other ST's equipped with TOS 2.06< can
read high density (1.4M) disks.
Reading the disk means it will read the directories and ASCII text,
an ST won't run DOS programs without an emulator. I frequently
import Lotus files from a DOS machine into LDW on Atari. Word Perfect
files are a mess of control codes, which have to be laboriously
removed, but it is possible.
Some programs, such as MaxiFile and TLC Formatter, have a DOS compatible
format option, so that these Atari disks can be read by a DOS machine.
I say most of the time, because some DOS machines will not read a disk
written by another DOS, much less an Atari. I've yet to encounter that
problem on Atari-Atari, even though I routinely format to 820K.

Hey you get the MAG? cool.... I think you should mail the editor with what is happening in NZ from time to time (you can do it through me if you like hehehe), he is always looking for stuff to put in the MAG...

MACE at the moment is going thru a bit of a transition at the moment, It is about to go RATSOFT on the BBS (Michtron has seen better days), we have a new president, and a couple of us "net" animals are gradually converting the masses to get on to the net. Things are reasonably healthy here in Oz Atari-wise, regardless of the rubbish that comes out of R.S's (hmmmm..... R S now what could that stand for?) mouth.

Cya.

Well, Big Deal !
You really think anyone else than you still bothers with medium resolution ?
Who still uses it anyway. Hi-Rez is the way to go. Or go beyond and run
1024 * 768 * 256 + NVDI (like me).
Besides, benchmarks give a warped view anyhow, if you're running normal
GEM-applications not all tests/GEM-calls have the same effect on performance.

>HDscan software then you need only mail me...

This is *definitely* wrong. The Link merely translates the SCSI-signal from the
drive to ACSI and as such has *NO* ID at all ! The SCSI-drive(s) define the ID.
So either change the ID of the external SCSI disk (every brand is different
I'm afraid) or:
Open megafile, look through round hole in shielding just in front of fan,
you'll see a red dipswitch. With a pen or similar flick the middle switch of
the three towards you. Thereby you've set it to ID 1 instead of 0. Don't touch
the switch located to the right BTW.
The computer always boots from the drive with the lowest ID, so decide first
which drive you want to change before doing it.

Regards,

>
>-Brian Becroft (mbecroft@iconz.co.nz) -Keeping Atari Alive in New Zealand-
>-President Tariland Computer Club Auckland New Zealand--------------------

!!! You will need a bit of knowledge of electronics for this.
!!! Don't blame me if you blow something up.

The trick is that you always supply power to the controller (the little box
between ST and SLM)
You need a 5 V supply such as a *modified* mains-adapter. Modified because
you need a truely stabilised 5 V supply and typical units don't provide such.
This is _very_ important because you wreck the whole controller with a mere
6 Volts. So verify with a multimeter; it should be within 4.75 - 5.25 V (!).
A 7405 + 2*100 nF cap's are most helpful for this job.
Q: what is a 7405 ?
A: you better forget about this :)
Open the box, locate the biggest elco, and solder the new supply onto this.
Don't ask me which lead is positive and which negative, if you don't know you
had better not try this mod yourself ;-)
The last thing to do is make *sure* the supply-trace(s) that go towards the
SLM are all cut. That is, *you* have to cut them. This is the tricky bit.
(you can't have two powersupplies in parallel because one will start smoking)
Where those traces are and to which pin(s) they go I don't remember, alas.
You're on your own there I guess. Try following the traces yourself, which
is difficult because it's a double-sided PCB.

Email me for insults / begs / info / new printers / legal harassment ;-)

Any ST that has a double-sided floppy drive (all but the earliest ones) will read 720K (DD) MS-DOS disks. All STs, TTs and Falcons with a 1.44-M drive will read 1.44-M (HD) disks. The disk formats are the same; the boot sector of a TOS disk sometimes is unreadable on a PC. In all other respects they are the same.

Thing does not care what flavor of GDOS you are using. It uses the GDOS device-independent method for font display. MagiC has nothing to do with fonts or GDOS, but you should consider upgrading to it.

There are some excellent RSC editors out there, including some that handle icons as well as other kinds of RSC files. Thing's icons can be changed using one of them.

>
> Using NVDI v2.5, I got 275% for display tests....

1. Use the LATEST versions when testing.

2. Test ALL not only display.

With the newest versions, Warp is faster.

I've just got hold of v1.20 of Oasis but I'm having problems getting it to run on my Falcon I get an error026 when I start. That's not to say it won't run on your system though. It claims to be alot less buggy than the last version and also alot quicker. It might be worth ftping this version from somewhere.

>Subject: TOS.IMG

>I want to make a TOS.IMG file. At what adress does the TOS ROM start, and how
>large is it? (I want to be able to get 1.x and 2.06, if there is a difference)

TOS 1.4 : start at FC0000 end = FF0000 size = 192K
TOS 2.06 : start at E00000 size = 256K (I'm not 100 % sure this is the right start address).

>And: is there any chance of burning a v2.06 TOS.IMG into some EPROMS, and have
>it work in this 520STfm? (upgradeing from 1.0 to 2.06 without one of those
>special cards)

No way. The reason they made those special cards is that TOS 2.06 starts at a different address. Also TOS 2.06 is written to run relative to this address. You need some modifications in hardware.

CU,
Ids.

Quick ST eventually evolved into Warp 9. However NVDI overall is almost as fast
and faster in many respects as Warp 9, it is far more compatible and allows you
to use Speedo & Truetype fonts for not a hell of a lot extra. Americans rate
Warp 9 & Europeans rate NVDI-explains it all really!

Sorry about that-probably my fault. The Link had an ID of 8(maybe 7) as far as I know and this will pobably conflict with either the host in the megafile or with either drive. I can't really help you except to say use the HDscan program or use an HD util which can scan the id's of device eg Diamond Edge, ICD Utils etc. This wil give the ID's so you can see which ones are conflicting. Changing the ID on the LINK is not to be recommended as the host adaptor is expected to have a certain number. You will have to find out the id's then examine the jumpers on your drive either SCSI or Megafile as i understand it, the pins are normally in banks of about 10 accros and almost always 2 pins wide and the 1st 3 pins are for the ID as follows:

```
ID: 1 2 4
Pin Row 1: 0 0 0 0 0 0 0 0 0 0
| |
Pin Row 2: 0-0 0 0 0 0 0 0 0 0
```

The pinout shows both pins of 2 & 4 jumped together and 1 is left blank which gives an ID of 6. If you find out the ID with software you should be able to decode which pins are which. I can't help anymore for now but if you need the HDscan software then you need only mail me...

> Medium Resolution. And NVDI (v3.02) gave only 223%. So your statement is wrong.
>
> Warp is faster.

That's allmost the truth 8-).

Warp 9 is faster with TEXT. Warp 9 doesn't improve the speed of graphics
(unlike NVDI).

The speed of WARP vs NVDI depends on the weighting of text against graphics
in the benchmark program and in your applications.

If you are only using editors, WARP 9 is faster. But in this case NVDI 3.0x
provides Speedo and TrueType fonts which you might need.

If you are using vector graphics (KandinskY, chart programs etc) WARP
is allmost as slow as plain TOS and NVDI is REALLY fast.

==========
The speed of WARP 9 vs NVDI depends on the type of your program.
==========

2345. THING: Icons & Fonts

Newsgroup: comp.sys.atari.st
Date: 1995-08-16 00:00:00 UTC
From: grillo@olivea.ATC.Olivetti.Com
Message-ID: <40s62d$pgq@olivea.ATC.Olivetti.Com>
Source record: 160678

HI there,

I started playng with that fine piece of software that is THING,
it's very good and I'm considering to register...but I have two questions:

1- Is it possible to replace/change fonts using GDOS/Tos 1.4
(so no Magic neither Nvdi..)

2- Which is the best/easy way to import or design new icons ?
I tried with some resource editor but frankly was a nightmare
so I give up....

Thanks in Advance.......

From: grillo@olivea.ATC.Olivetti.Com
Message-ID: <40s68b$pgq@olivea.ATC.Olivetti.Com>
Source record: 160679

Hi There,

I have some problem using SuperBoot (8.1) and G+Dos (tos 1.4)

I'm using TOS 1.4 - 4 megRam - ICD 6.23 scsi driver

G+Dos want to be the first program in the Auto folder but
superboot MUST be the first to properly work.

I tried to put gdos after superboot but it hangs the system,
so I put it BEFORE superboot, and I set a boot configuration with
Gdos ,in this way it works but I have to reboot TWO time selecting
the same boot configuration to see gdos active.

Any Hint/Tips on how to setup gdos/superboot properly?

Thanks a lot

Yes, but, if you read his product literature it says it will run
90-95% of all Atari software. I think games make up about 75-80% of
the ST's library. So, where's that figure come from. Also, it doesn't
say it won't run games or that it will only run gem software anywhere.
All it says is that it won't run copy protected software. So, if there
was a way to make a workable, unprotected copy of say, Dungeon Master
on a non-twisted, normally formatted disk, then it should run. That's
the reason for my question. So, from now on, if no one has an answer,
please don't respond. Thank you.

Sincerely,
- Byron Followell

From: Ari Feldman <ari2550@delphi.com>
Message-ID: <J-AgLAd.ari2550@delphi.com>
Source record: 160685

Yes, on the Atari (or any computer for that matter), it isn't easy to
get emulators to run copy-protected games. The reason is quite simple:

The Gemulator is a software emulator - it emualates most of the ST's
features but not necessarilly its unique components such as the
Shifter or the WD1772 FDC which wrote the copy protection in the first-place.

Theoretically, it *might* be possible to write emulation code in the
Gemulator to handle copy-protected disks since the PC and ST share the
same disk structure - but even if this was done (and its still a pain-in-
the-ass to bother with), there's no guarentee that the games would work.

ST games have always relied on tricks or quirks of the systems to do
their magic. The Gemulator would have to emulate things such as
Raster scans, VSYNCs, digital replay, etc. So many things can go wrong
with such emualtion that it probably just doesn't pay.

Ari

2353. problems w/Falcon/SM124?

Newsgroup: comp.sys.atari.st
Date: 1995-08-16 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <hZGhzmM.johnhechtman@delphi.com>
Source record: 160686

I just yesterday set up our new (well, almost new) Falcon and hooked it up to our trusty SM124 mono monitor. The good news is that Notator Logic and the Falcon get along great (grin). The bad news is that there seems to be a lot of noise on the SM124 picture. There are also some faintly visible vertical bars on the screen that "shimmy" when any drive is accessed. I got the VGA to SM124 adaptor from Toad and tried the snap-on ferrite bead noise filter that comes with the adaptor, but the problem persists.

My question is, is this normal using the SM124 on the Falcon? I got a less noisy picture with _no_ vertical bars or "shimmy" when it was hooked up to the old 1040STe. Why should I get _worse_ picture quality with the Falcon?

I'd like to hear from anyone who's used the SM124/Falcon combo. Tell me what kind of picture quality to expect. Would a VGA monitor solve the problem? I want to make sure I _have_ a real problem before I start busting the chops of the guy who sold me the Falcon ;)

Thanks in advance to all who reply! It would be especially helpful to direct your information to my Internet address as I am posting this to a number of places to get the broadest possible response. Post replies to: "johnhechtman@delphi.com". And thanks again! (grin)

You should be able to configure and use OASIS/NOS with any provider which can provide SLIP or PPP accounts. I've configured and used it for .netkonect with no problems, so it isn't Demon specific.

>More specifically, does it do POP over PPP?

Er... POP? If you mean POP3, that's a mail protocol. There is a modified version of NOS 0.42 which handles POP3 mail which you can use with OASIS. Connect to ftp.demon.co.uk and look in /pub/atari/ka9q/contrib/ - I think the file is called nos_pop3.zip or similar.

Cheers,
Frank.

Results of Survey
~~~~~~~ ~~ ~~~~~~

First a big thanks to everyone who took part, I'm sorry if you wished to take part but missed out on this survey. The results are based upon the 66 responses I received (including myself), of which many of you owned several machines, and a number of you answered for the other members of your family or club members.

Overall a very good response for a survey that ran a little over a week. Based on my results I may decide to run a more in depth survey in the future to see how much many of you have expanded your systems.

The results are as follows (please allow for any very minor discrepencies in these figures as the calculator I'm using on the SUN here in work seems to be emulating Pentium maths logic, or put another way the results vary for the same sums from one input to another). I have to combat this ran the figures through 4 times and balanced them out roughly.

```
================================================================================
Machine Number counted Percentage Comments

TOS Based:

ST 69 32.86% Large as expected
STE 27 12.86% Less than I imagined
Mega ST 13 6.24%
Mega STE 3 1.44%
TT 12 5.76%
Falcon 52 24.96% Lot higher than expected

George, perhaps you haven't check any Atari magazines in the last few years.
Branch Always Software moved to Washington state in 1990, so the Ontario
number and address you have is way way way out of date. Quick ST 2 was
upgraded to Quick ST 3 in 1991 which was then upgraded to Warp 9 in 1992
and is now sold by Codehead. So just call any Atari dealer in the known
universe and ask to buy Warp 9, and what you are really getting is an
upgraded version of Quick ST II.

From: Mark Butler <Mark@dwell.demon.co.uk>
Message-ID: <446577233wnr@dwell.demon.co.uk>
Source record: 160697

Re - the lottery is a Con by the government.

I'm not the government! - Although I do agree that the lottery on the whole is a bit a a con - i.e. we buy the tickets and some opera that most of us will never see gets x-million pounds.

The program makes no claims to improve your chances significantly, and is very honest about the actual chances of winning - Quotes in the manual file include the fact that your chances are 14 million to 1, And that 50% of the money is given away, and the rest is heavily biassed towards the jackpot.

You will get approx 24% of your stake back.

Lottery Companion simply makes things easier for those users who choose the play the lottery, especially if you run a syndicate.

Personally its a bit of fun for a couple of quid a week. Definately NOT to be taken seriously.

The program is very usable in unregistered format, and the registration fee is a measly five pounds. And the amount of hours that I have spent on this project doesn't add up to many pence per hour for my trouble.

By all means have a go at the government (I work as a engineer for BT - so I've got plenty to contribute) - But as a programmer still supporting the Atari, I would appreciate it if you didn't have a go at me persionally (Maybe I'm being a bit sensitive - but we do get attached to our programs!)

Thank you for your time - Especially to all those who have so far shown an interest, which includes a lot of very interesting people, I've enjoyed talking to you all..

> 1- Is it possible to replace/change fonts using GDOS/Tos 1.4
> (so no Magic neither Nvdi..)

When you are using Atari's FontGDOS, you can use any GDOS fonts for
Thing's windows. Just copy all the files from GEMSYS-folder of Thing's
distribution archive into your local C:\GEMSYS-folder on your harddisk
and edit C:\ASSIGN.SYS:

PATH = C:\GEMSYS <- this is the folder, where all FNT-files are

04p SCREEN.SYS <-- use 04p for 640*400 ST
DCHENM05.FNT 03p for 640*200 ST
DCHENM07.FNT 02p for 320*200 ST
DCHENM11.FNT
DCHENP07.FNT
DCHENP10.FNT
DCHENP13.FNT
DCHENP17.FNT
THING04.FNT
THING10.FNT

With VDIFont (sorry ... i don't know where to FTP it...) you can
replace the system font too - but alternate system fonts must be
8*8 or 8*16 pixels!

> 2- Which is the best/easy way to import or design new icons ?
> I tried with some resource editor but frankly was a nightmare
> so I give up....

Try any RSC-editor wich is able to handle colour icons (Interface, Zoom)

or

use only MONOICON.RSC (remove ICONS.RSC, copy MONOICON.RSC to Thing's
start directory and rename it to ICONS.RSC) and you can edit the resource
with every RSC-editor wich is able to handle standard monochrome GEM icons.
(e.g. ORCS, WERCS etc.).

> different address. Also TOS 2.06 is written to run relative to this address.
> You need some modifications in hardware.

Or hack the TOS.IMG? Oh well.

The simple program I wrote to dump TOS 1.0 in GFA Basic 2.0 doesn't work, I
just get a file full of 0xFF's when lookd at with MemFile (3.0). it looks
something
like this:

```
open "O",#1,"c:\tos.img"
bput #1,&HFC0000,192000
close #1
```

I also tried using MemFile's copy command to do this, but it skips the last 6k
and gives me a "Can't copy one or more addresses" or somesuch error. Arrgghh!
Has someone already written a program to dump TOS.IMG files? Anyone know of any
better Hex editors that can copy RAM/ROM into a disk file? Could someone just
send me a 2.06 image file?

Any D/S disc (720k) formatted on my PC is read by my STE, but Discs
formatted on the STE can't be read on the PC.

The formats are almost identical - It's just that the ST is more aggreeable
than the PC.

There are programs that allow the ST to create a disc that the PC will read
- But I prefer to work the other way.

bikerbob@wchat.on.ca (James Schofield) writes:

>Does anyone have an stats and opinons as to which is better from the
>accelleration point of view. Now Warp 9 has the screen saver stuff but
>NVDI has the new GDOS routines written in as well.

I have only recently made the jump from Warp9 to NVDI and I'm continually amazed that it took me so long to do it. I get roughly 110% _BETTER_ screen acceleration with NVDI than I did with Warp9 (using GEM Bench) and I have had a _SIGNIFICANT_ decrease in crash prone-ness with my Falcon.

Nothing scientific about this, but here's me gut reaction to both products:

Warp9 developer is slipping out of the Atari community, future enhancements are not likely to appear.

NVDI version of GDOS is _NOTICEABLY_ faster than SpeedoGDOS. (It also has a utility for creating your own GDOS printer driver...)

NVDI is amazingly configurable, and allows printing to disk.

Warp9 has excellent mouse accleration controls, where NVDI is weak in this respect.

Warp9 includes a "PinHead" routine that speeds up loading program files. NVDI does not, and while ST users won't care (because PinHead is available for their machines) PinHead doesn't come close to performing on the Falcon as well as it does on STs...

Warp9 allows animated screen savers, which usually eat huge chunks of processor power. NVDI does not have screen saver feature at all.

What else? ..... I'm sure I"ll think of something.

Oh yeah... My final preference? I use NVDI. It's faster and more dependable.

] will have to resign yourself to only being able to run games that,
] A. aren't copy protected, and B. don't insist on playing tricks with
] the system.

It _can_ be done. I managed to get dungeon master to run off hard-drive
a while back. It still checked the file with the protection from floppy,
but everything else was from hard-drive. Didn't make a lot of difference,
as it takes so long to depack the code, it's almost the same speed :)

Am I doing something wrong, or do I have to be a master C programmer,
and Unix master to get Mintnet running? I downloaded it, but all it
consists of is almost 2meg of source code. Presumably I now have to locate
the correct version of Mint, GCC, learn to use GCC, compile it, and then
try to work out how to patch it etc.... Is there any point in my
trying to get SLIP running decently on my ST, or shall I turf it and
by a cheap 286 or something to do it on?

Well I use BOTH warp and nvdi2.5 and nvdi3.0.

Personally i use warp for just about everything. But with nvdi 3.0 and speedofonts and TT fonts you cant go past it on ATARI WORKS & PAPYRUS (the demo version unfortunately) its great and really makes works quicker IMO.

I took the totally unscientific approach as far as choosing which accelerator by using my eyes. It seemed to me that Warp "looks" faster.

Mind you for musical stuff, NOTATOR SL (my seq of choice) should be run completely clean for safety reasons and even tho Cubase is supposedly compatible with NVDI, I still won't take a chance if i am using that program.

I've never really had any problems with WARP!

Re: _NVDI vs Warp9_, Maarten van den Berg wrote to All on 16 Aug 95:

MvdB> You really think anyone else than you still bothers with medium
MvdB> resolution ?

My guess is there are more people using ST Medium than any other Atari resolution, including ST High.

MvdB> Besides, benchmarks give a warped view anyhow, if you're running
MvdB> normal GEM-applications not all tests/GEM-calls have the same effect on
MvdB> performance.

True, and the CodeHeads have been saying as much all along, but NVDI advocates have been using benchmarks for years to make their case, so I think turnabout is fair play.

Just as an aside to the rf shielding issue. If someone did power up 500 watt cb amplifier they'd likely be paid a visit by the police before long as the legal limit is 4 wats (both USA and Canada). It would do more than mess somebodies falcon. The harmonics of the CB frequencies tend to sneak out easily and would land in the aircraft bands quite noisily.

It is NOT *definiely* wrong at all. Virtually everything I said was right(if not
all of it), obviously you have/have used a Megafile and you were better equiped
to this specific problem, the info I gave was corredt but inappropriate. Only a

few weeks ago I would have agreed with you that the Link had no ID but I quote from the HiSoft Squirel Storage Systems manual: " ... This is normally a numer between 0 and 6, allowing up to 7 devices to be connected on your SCSi chain (SCSI interfaces often have an ID of 7)." So who is more likely to be right-The manufacturers or a bloke with a Megafile?

While this is still fresh, I have a MagicCMac question that fits
into this discussion. I just installed NVDI for the Mac and in
the docs it states that it is compatible with Mac screens. With

out going into detail of the set up, I can not run 640*480 in 16bit (15bit<grin>) color. As a matter of fact NVDI refuses to load in that mode at any color setting except for mono,(looks like an assign.sys error), however at 800*600/256 everything is fine. Any Ideas? The machine is a Qudra 630/fpu/32meg ram/standard video (?).

I agree about a stab in the back. I just purchased the Falcon Field
Service Manual from B&C Computer and in their add they announced
that new Falcons would be available in Sept. As I don't think Toad
could offer the C-Lab Falcon for re-sale at a profitable price, they
must be talking about Atari's rumored new production run.

2392. St/Falcon Ratio Thoughts!

Newsgroup: comp.sys.atari.st
Date: 1995-08-17 00:00:00 UTC
From: msh@mserv1.dl.ac.uk
Message-ID: <40v2oc$et9@mserv1.dl.ac.uk>
Source record: 160620

Well I've had a number of people contact me saying how interesting they found the results and how they'd like to take part in future surveys. A few interesting points that were raised included the high level of Falcon to ST computers. Sure if you add in STE's as an ST it is more like you'd expect but it was very high. Also people have mentioned that there seem to be less STE's and Mega ST's than they imagined.

Additional to the results given I have spotted a few that slipped through. These are a Falcon, a Jaguar, and an Atari 2600. Sorry about leaving these off. From my personal knowledge of peoples Atari range I could have extended the survey further but didn't want to do this, besides I know it would have added more Falcons and not so many extra ST's.

Question is then why is the number of Falcon's in comparison to other machines so high? I don't really have an answer but I can generally say most replies where either:

1. An ST or a few, another Atari and perhaps a Falcon (shows an upgrade path).
2. A single high spec Falcon (by high spec I mean lots of extras bolted on).
3. An ST another Atari and a PC or Mac (again shows an upgrade path).

Nobody in the survey from memory had more than one Falcon (odd exceptions were computer clubs with several of each machine). Very few people has a single ST, or at least a single un-expanded machine and no others. Lots of people owned 2 or 3 machines.

Draw your own conclusions but I'd love to read any further thoughts to this in a thread here. It would seem numbers for a Falcon group that several people requested in the survey may be justified.

Hi,

I need TOS 2.06 to try STonX, the old TOS 1.4 in my ancient ST
dosen't work, since I will use it for STonX only a img file
is all I need (no ROM:s), I know TOS is Copyright Atari, so my
questions are:

Is Atari selling TOS 2.06 as a separate product ?

Is there some upgrade 1.4 -> 2.06 options ?

Or even better may I use TOS 2.06 free if I can get a copy of it
from some generous person on the net (hint hint...) since I do
own an Atari (which ofcourse includes a TOS right to use license) ?

If I have to buy it can someone give me a hint of a store in Sweden
that is selling it, the last store that sold Atari stuff around
here was closed a while ago.

Date: 1995-08-17 00:00:00 UTC
From: asmodeus@telerama.lm.com
Message-ID: <410dt4$4sr@india.lm.com>
Source record: 160630
Cross-posted to: comp.sys.atari,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech,misc.forsale.computers,misc.forsale.computers.other.systems,misc.forsale.computers.other.software,pa.forsale,pgh.forsale,pitt.forsale,us.forsale.computers

Most software has original boxes and documentation.
All software are original disks, not back-ups or copies.
Some of the hardware also has the boxes that they came in,
but some do not, such as the hard drives, disk drives for parts,
1040 case and RF shield, etc.

All prices are in US Dollars and do not include Shipping costs.
All prices are negotiable and open to reasonable offers.
Payment by personal check will be shipped after the check clears
my bank, aprox. 5 working days. Payments by money orders will be
shipped the day after payment is received.
Priority will be given to orders of 5 or more items.
This list current as of: 8/17/95

Item Name starting with (P) is possibly sold, in negotiations,
or awaiting payment.

ATARI HARDWARE FOR SALE:
ASKING
PRICE ITEM NAME

$350.00 1040 ST/F 4megs mem., tos2.06 TEC board,
ADspeed 16mhz upgrade.
$175.00 1040 ST/F(M?) 1meg memory MIGHT BE 520
$350.00 1040 STE 4megs mem.

Check out which DMA IC is in your computer. In an STe, it should NEVER be
C025913. If it is, you should exchange it.

Best regards,

Claes

Only possible thing, as far as I know, is to leave the HD's running at all
times. The problem is a sign of the motor giving up - even though it's possible
to keep it alive for some time (probably a long time) - there is no solution
but to exchange the spinning motor (if they are possible to come by...).

Best regards,

Claes

All Cubase versions (except Cubase Audio) runs on 1MB machines. However, if you plan to make score editing, you'll need at least 2MB. As far as I know, all versions are distributed on double sided disks, so there is a big problem if you don't have one.

Have a nice day,

Claes

Hello Teemu,

> I don't even own a ST yet (trying furiously to buy one, thought), but I
> would
> like to know is it possible to read MS-DOS formatted disks with ST. Or
> is it possible to write atari-format (TOS isn't it?) with PC? I
> remember reading that the procedure is possible, but how?

The ST has no problems reading PC formatted disks - as long as they are
formatted as 720kB disks. The Falcon uses the 1.44MB format as well and older
machines can be enhanced with an 1.44MB drive (if you get an Ajax floppy
controller, TOS2.06 and make some other small modifications).

Best regards,

Claes

I think you should check out Cubase. You can work in some different ways with
it and as far as I know, it's the only commercial program that certainly will
be developed further. The function that you need could maybe be something like
the Group tracks in Cubase. Try it - you'll like it!

Best regards,

Claes

Landstrider <mgrove@owens.ridgecrest.ca.us> said:-

>Expos'e plugs into the Falcon PD port. Sorry :(

Although David at Titan have stated that it would be theoretically possible to redesign the system to work with TTs and even STs, but they'd have to use the cartridge port as the interface. Considering Expose gets its speed from using the expansion bus, a cartridge Expose probably wouldn't be anywhere near as good :(

Cheers,
Frank.

|tom.thomason@fpc.ct.se (Tom Thomason) wrote:
|>The latest news I've heard is that Atari have started up the Falcon
|>production lines again due to sufficient orders having been placed.
|>This is, in a way, good news, but it's also somewhat of a stab in
|>the back for C-Lab, whose contract, AFAIK, forbids them to produce
|>low price Falcon clones as long as Atari themselves have stocks of
|>standard Falcons.
|
|I agree about a stab in the back. I just purchased the Falcon Field
|Service Manual from B&C Computer and in their add they announced
|that new Falcons would be available in Sept. As I don't think Toad
|could offer the C-Lab Falcon for re-sale at a profitable price, they
|must be talking about Atari's rumored new production run.

Oh, pleeeease, people. Come on now. Toad's announcements and latest
catalog references the C-Lab Falcon packages specifically. Imported
C-Lab machines may be expensive, true, but they will likely sell a
lot better than a warehouse full of unsubstantiated RUMORS!

Enthusiastic optimism is one thing. Letting it overcome logic to
destroy your common sense is quite another.

>called nos_pop3.zip or similar.

I can't, for the world, understand why people would want to use SLIP/PPP for mail and news. SLIP/PPP _only_ makes sense if you want to use a graphical Web browser. I mean, the whole silly business is so theeth-grindingly slow, it's unbelievable. And anyhow, it is plain silly to use your own computer as a node in the net, since the machines of most providers - and you normally have access to them - are very powerful and fast Unix machines. Why not let them work for you? If you just logon with normal terminal software, you can make use of that fast multitasking machine to gather your mail and news for you, and compress it in a neat (SOUP) package for subsequent downloading. Just write two simple scripts, one for mail and one for news, run them in the background and you are free in the meantime to explore the Web, or do an ftp session. Nothing can be easier and more time and money saving!

One dramatic example. Today I gathered 250 news articles from my host, using NOS and PPP. The session averaged a CPS rate of approximately 600 - with a 14K4 modem - which is quite fast, because normally I reach only about 200. And that is _uncompressed_ date. Using zmodem to download compressed mail and news packages I easily average a CPS rate of 1600-1700, making this method, since compression of ASCII files usually reaches 50 percent, about six times faster. And to this must also be added the (long) time it takes to connect to the newsserver, etc. All together, the PPP session lasted about fifteen minutes. I then contacted the server again to gather the same batch of news in a SOUP packet, compress it and download it with zmodem. Total login time: a little under two minutes. Count your blessings!

And what's more: There exists an excellent offline mail and news reader for the Atari which can handle SOUP packets. And it has been

around for years. It is a GEM program at that, very versatile, very elegant, very flexible, and _very_ stable. It's available on most of the major Atari ftp sites.

Now you can stop scratching your head.

Source record: 160503

Well, I've been searching for a better term proggie to replace ANSITerm. I don't like TeddyTerm, Connect puts your terminal in a window, which doesn't allow you to get a full 80 column screen on an ST-medium screen, the Silent Line function of Flash II is incredibly handy, but Flash really sucks otherwise. So far FzDSTerm meets my needs. But I need a key, and I'd really like to have a GEM interface, I think I'll have to finish my CalTerm program... (STalker sounds neat, is there a demo somewhere?)

What do people recommend for viewing pictures on ST these days? I am particularly interested in GIF and JPG formats. If you know which techniques a program used I would be interested in hearing about that. I know that STs are not very good for viewing pictures, but many clever ways have been thought of which reduce these limitations.

No, you're doing everything right. IIRC, the distribution _is_ mostly
source, but the binaries are in there somewhere. Look for socket.xdd and
slip.xif files. It's been a while since I've set up my system, so I'm not
sure if there's more to just tossing the *.xdd and *.xif files in you
c:\mint folder, but try it, and it should work. Whether you'll actually
be able to do anything is another story, since MintNet doesn't actually
supply the software you need to dial in to your provider. Get the MintNet
FAQ, uploaded fairly recently to a.a.u.e, according to a posting here,
and you should be doing a lot better...

>Can someone tell me what software's needed/available for me to become an
>FTN point?

1) A Mailer program, to call your node and send/receive mail packets - either BinkleyTerm or Semper will do.
2) A Mail processor, to import and export the mail bundles, pack areas and so on. A number exist, such as MarsMail, IOS and JetMail.
3) A message reader. Only one, really - LED.
4) A nodelist compiler, to erm, compile the nodelists :) BTNC or similar.
5) Standard archivers (STZip, LHarc).

There are other nice things you can add, like a shell for the whole kit and kaboodle. Both Avalon and Mr. Pointy are good.

>Any idea where I could get it (in the UK if non-internet ;).

I haven't seen much FTN stuff on the net, TBH. Any major UK BBS which is connected to NeST/AtariNet should be able to supply the lot. Paul Civati also wrote a very good FAQ on pointing - he might well reply to this anyway, otherwise try mailing him at paul@xciv.demon.co.uk for it.

Cheers,
Frank.

Message-ID: <RVEDjQp.ari2550@delphi.com>
Source record: 160508

Getting cracked versions of games is one answer to the problem but
I certainly don't recommend it for two reasons.

1. Its been my experience that many cracked games simply aren't as stable
as their original counterparts. Crackers remove or modify portions of
the original program and in some cases, they inadvertantly introduce
errors into the game. This can also happen when they hack their own
intro screens (which often tend to be better than the game in the first
place).

2. Cracking games just isn't right! I regret pirating things in the past.
Piracy was one of the factors that led to the demise of some ST developers.

Ari

Success: MIST AtariFest VII at Indianapolis July 29, 1995
Next Year? It'll be a week earlier if all goes well in '96!

Sorry to be so late with a report, but ....

Success of MIST AtariFest VII is official: David Troy proclaims it on the
Toad Computer Home Page on the World Wide Web (http://www.charm.net/~toad/
[changed as of mid-August to http://www.toad.net/ and to
ftp://ftp.toad.net while the Troys are dave@toad.net and
jennifer@toad.net]) ... but the main message is that if you missed
MIST VII, you missed super Atari action.

Co-Chair Charlie Sears says in a preliminary report that
attendance was down -- but the two ballrooms provided so much
extra elbow-room that everyone could spread out in the double
space.

Ticketed attendance totaled 257, off only 20 from 1994. That's
barely 40 down from earlier years when the MIST guess-timates
were "about 300."

Gross revenue is will exceed expenses to pay the hotel and cover
other costs such as promotions and postage.

Next year? Another AtariFest? That's the obvious plan, but how
can appeal be widened? Perhaps MIST can incorporate more of the
era's reality, such as the interest in Jaguar game machines? And
by then the Atari Virtual Reality machines may be considered a
part of the program, too. Post your opinion, please!

BTW: The Best Western Hotel is not available on the LAST
Saturday of July next year. It is available a week earlier, July
```

20, 1996. Pencil in that date, but remember that the date of any event next year is likely to be July 20.

Five Jaguar games donated by Atari Corp. were sold at a silent auction. Top bidders and prices on each game:

-- Alien v. Predator and T2K to Edward Baiz, Granger, Indiana
-- Iron Soldier and Doom to Alan Horton, Berkeley, Illinois --
Hover Strike, Marcella Elswick, Columbus, Ohio

Winner of the Jaguar game machine donated by Atari Corp. as the No. 1 door prize was Douglas Hodson of Rising Star Computers at Dayton, Ohio, an AtariFest vendor in past years who came as a user this year. Dorothy Brumleve of Urbana, Illinois, was another former vendor who attended this year as a user -- and as a writer for the GEnie Light magazine.

Other door prizes and their winners:

BARE BONES SOFTWARE
-- Shadow of the Beast to Larry White, Mooresville, Indiana
-- Leander to Jim Banner, Ellisville, Missouri
-- Awesome ST to Richard Smiley, Kokomo, Indiana
-- Ork to Robert Mattingly, Rising Sun, Indiana
-- Armour Geddon to Roger Baker, Indianapolis

BRANCH ALWAYS SOFTWARE
-- PC X-former 3.2 to Henry Murphy, Urbana, Illinois

COMPUTER DUNGEON
-- Rock 'n' Roll Slams to Kathy Henderson, South Bend,
Indiana

CLEAR THINKING
-- EditPlus to Bill Haddick, Collinsville, Ohio

chroMAGIC
-- RAM Gizmo to Aaron Cardinal, Martinsville, Indiana
-- Pianistics to David Bullock, Beaver Creek, Ohio

CRAWLY CRYPT
-- Crawly Crypt Collection CD-ROM, Volume 1,
to Marcella Elswick, Columbus, Ohio

GRIBNIF
-- CardFile 4 to Rob Cable, Canton, Michigan

IT'S ALL RELATIVE
-- Walnut Creek CD-ROMs to:
Ronald Elsass, Wapakoneta, Ohio
Ralph Siemers, Plainfield, Indiana
Mike White, Schaumberg, Illinois

L.C.A.C.E
-- License Plate Holders to:
Craig Harvey, Ann Arbor, Michigan
Robert St. Clair, Fort Wayne, Indiana
-- 10 Public Domain Disks to Robert Goodwin, Louisville
MISSION WARE
-- Flash II to Nick Dimasi, Glen Ellyn, Illinois

MTS CREATIONS
-- Trak Ball to Kevin Yurkus, Lafayette, Indiana

SYSTEMS FOR TOMORROW
-- "Motorola Inside" T-Shirt to Sherri Thomas, Danville,
Illinois

TOAD COMPUTERS
-- ProStick to Dave Pennekamp, Norwood, Ohio
-- "My Other Computer Is an Atari" T-Shirts to:
Jerry Coppess, Greenville, Ohio
Hassen Hammoud, Indianapolis
-- ST Format magazine to Ronald Elsass, Wapakoneta, Ohio
W.A.C.O.
-- Star Raiders to:
Syndee Knight, Bloomington, Indiana

Your bushings are about to totally go out on you! The 157's and the other drive get a lot of heat build up in them and over time the bushings start to lose the lub that came with them. I've had 3 157's on my BBS during the last 3 years, two of them have burned up and frozen and could not be gotten to go again. I would make backups of everything on those drives and start looking for some new scsi drives. Also watch out for the platters on the 157's to start turning from chrome shine to burned black!

that seems a little cheap! at approx. 50$/meg RAM for 200$ you're getting a
free computer! I'd think approx. 700$ would be a more reasonable price as
compared to 2000$

This is a request for help from the Internet community.

I first off want to apologize for spamming on a massive scale. I will accept all flames like a man. I have been involved with Internet since 1989 so I know the extent of my trespass by posting to all newsgroups.

I am asking for help.

I have a digital publishing company that delivers fully formatted magazines directly to subscribers e-mail boxes. These magazines include all the text, graphics, and layout of paper magazines with the benefits of a digital format. What I am having trouble with is that although my format is by far superior to the Web for distribution of magazines I am too small of a company to create market awareness. I am asking everybody who reads this post if you could call, write, or e-mail any magazines that you read on a regular basis and let them know they might want to check into my service.

What I am doing for you is trying to talk magazines into distributing for free and making their money off of advertisements. So you would benefit by this as well as me. imagine receiving quality magazines directly in your e-mail box, FOR FREE!

please, Please, PLEASE help me out.

I have no use for speedo, so why get NVDI 3? It just chews up & spits
out RAM I need. I understand your point though, but the good points
of NVDI outweigh the good points of Warp-9. Just the sheer compatibility
makes NVDI superior, plus the fact that, if you want it, it does
bitstream fonts in a manner superior to Speedo-GDOS.

> Falcon and perhaps other systems.
>
> THE Storehouse of the Arcane

You can get the new C-Lab Falcon MK-I and MK-II machines, which are both 100 % Falcon030 compatible. The difference from the Falcon030 and the MK machines is the quality of the sound system which is MUCH better on the MK-I & MK-II machines. The MK-II also has an internal SCSI-II slot.

Toad Computers in the US imports the C-Lab machines.

Other Atari compatible systems I know of are the MEDUSA T40 (& T60 - rare), EAGLE (New - don't know if it is avaiable yet), all MacIntosh computers with at least a 68030 CPU or better running the Operating System MagiCMac (the Mac-version of the Atari 32-bit multitasting OS MagiC v.3)

The Medusa T40 comes with a 68040 @ 64 Mhz (internal), the T60 comes with a 68060 @ 64 Mhz.

Lexicor in the US imports (I think) the Medusa T40.

The prices have been changing lately, so I don't know exactly what these machines cost.

Hope this helps...

Keep Cool and Flying...

That's allmost the truth. a xxx% acceleration doesn't say anything without
telling us, which resolution, whick graphics card and which machine you
are using.

: >
: >-Brian Becroft (mbecroft@iconz.co.nz) -Keeping Atari Alive in New Zealand-
: >-President Tariland Computer Club Auckland New Zealand--------------------

: !!! You will need a bit of knowledge of electronics for this.
: !!! Don't blame me if you blow something up.

: The trick is that you always supply power to the controller (the little box
: between ST and SLM)
: You need a 5 V supply such as a *modified* mains-adapter. Modified because
: you need a truely stabilised 5 V supply and typical units don't provide such.
: This is _very_ important because you wreck the whole controller with a mere
: 6 Volts. So verify with a multimeter; it should be within 4.75 - 5.25 V (!).
: A 7405 + 2*100 nF cap's are most helpful for this job.
: Q: what is a 7405 ?
: A: you better forget about this :)

STOP STOP STOP STOP STOP STOP STOP STOP STOP STOP STOP STOP STOP

A 7405 is a logic gate and will not do the job!

What you want is a 7805 voltage regulator!

Otherwise I agree with Maarten - only do this if you know what you
are doing with a soldering iron.

The software that Expose relies upon on the Falcon makes heavy usage of the
DSP and so even if a version was adapted for the other Atari's the chances
are performance would be greatly reduced.

2454. Nos and Dynamic PPP possible?

Newsgroup: comp.sys.atari.st
Date: 1995-08-18 00:00:00 UTC
From: P.A.Booth@bradford.ac.uk
Message-ID: <410ptf$kfj@columbia.acc.brad.ac.uk>
Source record: 160579

I read somewhere that someone had managed to get Nos working properly
with dynamic PPP. I think it was either here or .tech but I couldn't
find the article for the life of me (it was only yesterday that I read it
too :( ).

Anyway, I was wondering if it was possible to set up Nos (or
Mint/MintNET for that matter) to handle dynamic PPP using these
conditions that our CC gave us:

Access is PPP only.
Uses PAP authentication - normal usercode and password as keys.
DNS domain is brad.ac.uk.
DNS servers are 143.53.2.5 143.53.238.5 143.53.240.2.
Client *must* accept IP address offered.
Netmask is 255.255.255.0.

Any help on this appreciated...

Thanks in advance,

Paul.

Date: 1995-08-18 00:00:00 UTC
From: aa860@ccn.cs.dal.ca
Message-ID: <DDHMH2.5o9@cs.dal.ca>
Source record: 160582

Unfortunately, this was an actual Atari program so no one afaik, is
developing it. This is a shame as it only needs a couple of little tweaks
and ideas to be a super program. It is a good wordprocessor and I like
the database and how they interact but it doesn't even support odd or
even page printing which I find a major problem as I work on longish
documents with a 9 pin printer. This alone would be a fabulous
enhancement. On the other hand it has excellent mailmerge, very logical
and easy to write with so it is great for invoices, etc.
would strongly reccomend trying a copy first to see if it suits your needs!

>it work in this 520STfm? (upgradeing from 1.0 to 2.06 without one of those
>special cards)
>
Well, on the file called CHIPS212.*** was mentioned one trick
to do. I have used it and now I have upgraded my TOS 1.62
to 2.06 without any hardware modifications.
I just use few wires (3) to connect 2.06 ROMs correctly to
my STE board. I hope You have 2 chip TOS. Otherwise I can't
help.
I have used my STE few times and find nothing unusal on it,
except that new TOS. E-Mail me if interested...

Can someone tell me what software's needed/available for me to become an
FTN point?

Any idea where I could get it (in the UK if non-internet ;).

Rgds,

Paul.

2463. FS: (two) TT/030

Newsgroup: comp.sys.atari.st
Date: 1995-08-18 00:00:00 UTC
From: mats@netcom.com
Message-ID: <matsDDHvrL.G6u@netcom.com>
Source record: 160588

I've got a pair of TT/030's from an old project; I'm moving and
they can't go with me.

Both machines are loaded with Unix SVR4, and run x11r4.
Apparently, Linux can be run on these machines, which
would make for a more interesting platform for experimentation;
however they work quite well as is - they were my main machines
for a long while and I'm still using #1 as my "internet gateway"
(okay, so I dial in to a service provider with kermit, big deal...).

#1: 14MB memory, 200MB SCSI disk, 19" TTM194 monitor (mono),
ethernet card. The 14MB is attained by 2MB base ST RAM,
8MB expansion ST RAM, 4MB TT RAM.

Asking $600.

#2: 20MB memory, 340MB SCSI disk, 19" TTM195 monitor (mono),
ethernet card, QIC 150 cartridge tape (external).
The 20MB is attained by 2MB+2MB ST RAM, 16MB TT RAM.
The disk is split into a 50MB TOS partition, the
rest for Unix, and it's possible to switch between
them (the TOS partition is devoid of software, however;
it boots and that's about it).

Asking $850.

I've also got a lurking 4MB TT ram that came out of #2
when the 16MB went in...any takers? Make an offer...

Feel free to make me an offer for the lot.

I don't have a lot of feel for prices on Atari gear, but from
what I see here, these ought to be pretty good prices, esp.
given the amount of RAM. I'm in a hurry and want to move this
stuff out!

I'd prefer not to ship these, partly because I don't have shipping
materials (esp. an issue for the monitors) and partly because I don't
have time to deal with it; so SF Bay Area buyers would be best; if I
have to ship them, postage and COD charges will be added.

] True, and the CodeHeads have been saying as much all along, but NVDI ad
] have been using benchmarks for years to make their case, so I think tur
] is fair play.

ST-Medium, outside of Germany, is the standard ST-resolution used in
the majority of cases. The Falcon and other machines don't exist
in great enough numbers to change this.

GEM-Bench was written with the express purpose of being non-biased towards
any TSR, or any other software/hardware addition to the machine, so using
it in the same setup as whatever you're comparing whatever against,
should yield fair & accurate results. Me, I'd like a Pak030, with
4meg of RAM, and a 500Meg hard-drive, but other than the RAM, they're
all way out of my league price-wise, so I just put up with the small
compensation NVDI gives for speed, and Neodesk 4 gives for
functionality.....

2465. Wanted: D-50 bank structure info / Dr.T email address

Newsgroup: comp.sys.atari.st
Date: 1995-08-18 00:00:00 UTC
From: kruisweg@flatearth.xs4all.nl
Message-ID: <081895153141Rnf0.79b6@flatearth.xs4all.nl>
Source record: 160590
Cross-posted to:
rec.music.makers.synth,alt.music.midi,fidonet.midi-programming,fidonet.midi-net,comp.sys.atari.st,comp.sys.atari.st.tech

I've recently got a large number of Roland D-50 banks. The only problem is
that I've got at least half a dozen incompatible formats. For some of these
banks I don't even have a loader program. I'm thinking of writing a program
(Windows, maybe Atari ST) to convert all these different formats to at least
Dr.T and Synthworks, maybe others too if I get enough info.

Before I can start I have to find out the structure of all these formats. Who
has more info on the following D50 bank formats.

```
Ext Filesize
-----------------------------------------------------------------
*.D50 34688 (Dr.T, Atari, PC, Amiga, etc.)
*.BNK 70100 (Atari program: BANKLOAD.PRG)
*.MEX 36048 (Atari program, distributed by Dutch music store)
*.D50 34690
*.DMP 36048 (Mac sys ex dump?)
*.D50 49152 (Atari program: D50DUMP.PRG)
```

If you have banks in other formats, D-50 editors (PC, Amiga, ST), (email)
addresses of MIDI software publishers that have made software for the Roland
D-50, other useful information, please send it to me. I've already contacted
Steinberg, the address I need most now is that of Dr.T. Do they have an email
address? I also need a more recent email address of the author of the Atari
ST program MT32-D5-D10-D110-D50 Explorer, because the email address in the
README.TXT bounced.

The original post was to do with running it off of a PC or clone
with an emulator! Yep there were a couple of games that would let you run
them off the hard drive if you left the original disk in drive A to check
the copy protection. But that won't do him any good as whatever is being
checked for by the ST, fails on a PC drive! Wrong Hardware! Sorry! 8-(

In hi-res also?

What is the newest version of Warp 9 anyway? Is it still supported?

I usually prefer NVDI since it has built-in GDOS.

Yes, it was manufactured in small numbers before it was dropped. Recently I
saw one for sale here in Sweden so you might find one if you're lucky, but they
usually cost a fortune because they are so rare.

: like to know is it possible to read MS-DOS formatted disks with ST. Or is it
: possible to write atari-format (TOS isn't it?) with PC? I remember reading
: that the procedure is possible, but how?

A floppy disk formatted from an ST (with the standard formatter) can't
be read on a PC. A disk formatted from a PC can be read by both a ST
and a PC; once the disk is formatted, you can write to it with either
a PC or a ST, but not both, otherwise files get sometimes corrupted.

>C025913. If it is, you should exchange it.
>
If you are using a host adapter (instead of a Link I or II) then you
should exchange it instead. It is more likely that is the culprit. Faults
on a host adapter can sometimes let it appear the hard drive(s) may be
functioning ok. But in fact they can cause read/write errors to the FAT
and boot sectors which will scramble all of your data and partitions.
There may be absolutely nothing wrong with the hard drive at all, but you
can't tell that be reading the directory.

Get a spare adapter board and also get yourself Diamond Edge (file and
disk repair - defragmenter/optimizer).

"Star Trek Lost Episodes"

<Picard> "Mr. LaForge, have you had any success with your attempts at finding a weakness in the Borg? And Mr. Data, have you been able to access their command pathways?"

<Geordi> "Yes, Captain. In fact, we found the answer by searching through our archives on late Twentieth-century computing technology."

<Geordi presses a key, and a logo appears on the computer screen.>

<Riker looks puzzled.> "What the hell is 'Microsoft'?"

<Data turns to answer.> "Allow me to explain. We will send this program, for some reason called 'Windows', through the Borg command pathways. Once inside their root command unit, it will begin consuming system resources at an unstoppable rate."

<Picard> "But the Borg have the ability to adapt. Won't they alter their processing systems to increase their storage capacity?"

<Data> "Yes, Captain. But when 'Windows' detects this, it creates a new version of itself known as an 'upgrade'. The use of resources increases exponentially with each iteration. The Borg will not be able to adapt quickly enough. Eventually all of their processing ability will be taken over and none will be available for their normal operational functions."

<Picard> "Excellent work. This is even better than that 'unsolvable geometric shape' idea."

. . . . 15 Minutes Later . . . .

<Data> "Captain, We have successfully installed the 'Windows' in the command unit and as expected it immediately consumed 85% of all resources. We however have not received any confirmation of the expected 'upgrade'."

<Geordi> "Our scanners have picked up an increase in Borg storage and CPU capacity to compensate, but we still have no indication of an 'upgrade' to compensate for their increase."

<Picard> "Data, scan the history banks again and determine if their is something we have missed."

<Data> "Sir, I believe their is a reason for the failure in the 'upgrade'. Apparently the Borg have circumvented that part of the plan by not sending in their registration cards.

<Riker> "Captain we have no choice. Requesting permission to begin emergency escape sequence 3F . . ."

<Geordi, excited> "Wait, Captain I just detected their CPU capacity has suddenly dropped to 0% !"

<Picard> "Data, what do your scanners show?"

<Data> "Apparently the Borg have found the internal 'Windows' module named 'Solitaire' and it has used up all the CPU capacity."

<Picard> "Lets wait and see how long this 'solitaire' can reduce their functionality."

. . . . Two Hours Pass . . . .

<Riker> "Geordi what's the status on the Borg?"

<Geordi> "As expected the Borg are attempting to re-engineer to compensate for increased CPU and storage demands, but each time they successfully increase resources I have setup our closest deep space monitor beacon to transmit more 'windows' modules from something called the 'Microsoft fun-pack'.

<Picard> "How much time will that buy us ?"

<Data> "Current Borg solution rates allow me to predicate an interest time span of 6 more hours."

<Geordi> "Captain, another vessel has entered our sector."

<Picard> "Identify."

<Data> "It appears to have markings very similar to the 'Microsoft' logo"

<Over the speakers> "THIS IS ADMIRAL BILL GATES OF THE MICROSOFT FLAGSHIP MONOPOLY. WE HAVE POSITIVE CONFIRMATION OF UNREGISTERED SOFTWARE IN THIS SECTOR. SURRENDER ALL ASSETS AND WE CAN AVOID ANY TROUBLE. YOU HAVE 10 SECONDS"

<Data> "The alien ship has just opened its forward hatches and released thousands of humanoid shaped objects."

<Picard> "Magnify forward viewer on the alien craft"

<Riker> "Good God captain! Those are humans floating straight toward the Borg ship with no life support suits ! How can they survive the tortures of deep space ?!"

<Data> "I don't believe that those are humans sir, if you will look closer I believe you will see that they are carrying something recognized by twenty-first century man as doe-skin leather briefcases, and wearing Armani suits."

<Riker and Picard together horrified> "Lawyers !!"

<Geordi> "It can't be. All the Lawyers were rounded up and sent
hurtling into the sun in 2017 during the Great Awakening."

<Data> "True, but apparently some must have survived."

<Riker> "They have surrounded the Borg ship and are covering it with
all types of papers."

<Data> "I believe that is known in ancient venacular as 'red tape';
it often proves fatal."

<Riker> "They're tearing the Borg to pieces !"

<Picard> "Turn off the monitors. I can't stand to watch, not even
the Borg deserve that."

2482. Q: SM124 adjustments?

Newsgroup: comp.sys.atari.st
Date: 1995-08-19 00:00:00 UTC
From: psu01223@odin.cc.pdx.edu
Message-ID: <415ooj$aob@odin.cc.pdx.edu>
Source record: 160457

Subject says it all. I picked up a SM124 monitor at a garage sale--it works great but the picture is very small, there's about a two-inch border between the physical edge of the screen and the edge of the lit-up area. So I want to open it up and adjust the apppriate controls. I've done this before, but only on old IBM-type monochrome monitors. Can anybody give me any hints, tips, or tricks for adjusting the SM124?

Thanks,

Alex

> like to have a GEM interface, I think I'll have to finish my CalTerm

Wait -- you want a GEM interface, but not a GEM terminal? OK, FzDSTerm
is just about that. I don't know why you don't want a GEM terminal,
though. Might as well get it. Hang onto CoNnect. I don't know why you
can't get an 80-comumn screen. If you're going to get a Falcon (I
noticed you wanted one), it will work very nicely (I know, I use it).

As for getting a key for FzDT: Why don't you register it? You might
want to check if good 'ole Aaron is still in business, though, because _A
LOT_ of people didn't recieve their keys after they registered. He
should still be around, if he's not in jail for fraud <g> =)

: superboot MUST be the first to properly work.

Scrap your G+Dos and use G+Plus which doesn't need to be the first in
line. Also SuperBoot (v8.1) does not need to be the first program in auto
folder to work properly. Simply hide the files from SuperBoot via the
"hide" function built into the super_cs.prg.

just recently someone asked if I knew how to set the scsi id on a megafile.
well the megafile documentation tells you how to do it on the magefile case,
but if you remove the syquest from the case you might be stuck :^)
here's what i've dug up:
looking at the back of the syquest

power : : : : : :
supply
P T C B A
P=parity
T=test
C=4
B=2
A=1
if A is jumpered (second from the right) then you have a scsi id of 1,
if A and B then a scsi id of 3, etc
if anyone sees anything wriong with this don't hesitate in letting us know.

Syquest tech support

If the problem is just getting the files onto the PC then that's no prblem.
If the ST you were using had a TOS of 1.4+ all you need to do is put the
disk in the drive and the PC should read them no prblem. HOWEVER if the disk
format is a bit odd (TOS 1.2 or some PD formatter) then the PC wont read them
directly. :(

You can read these oddball disk formats using a PC program, which I cant
remember the name of. Sorry. :(Anyone?!

2500. Hard Drive help in Houston

Newsgroup: comp.sys.atari.st
Date: 1995-08-19 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <413qr0$s96@batph8.bnr.ca>
Source record: 160524

Hello all.

I have a friend in Houston who was messing around with his Hard drive configuration. It seems he has overwritten his partition sector and now the drive can only see the C partition. I am 99% sure the rest of the data is intact on the other partitions, but unfortunately he does not remember the partition sizes (otherwise this would be just an academic exercise).

The best solution I could offer him was to rewrite the drive partition table with a large C partition then use some kind of sector scanner to scan for some pattern that appears in the first sector of each logical partition, thereby finding out what sector number the next partition starts at.

Unfortunately, I don't know what to scan for, and my friend really only has the Atari for its MIDI capabilities (read: he doesn't know much about what I am talking about).

Now, myself being from Austin, I know there is a large Atari contingency in Houston. Would someome from there be willing to help my friend recover his hard drive? He is willing to pay for any services rendered.

He lives on Enclave Parkway in the 77077 zip code, if that helps you place what area of the city he lives in.

His system, from what I remember, is a Mega 4 ST, Monochrome monitor, ICD Link, ~85meg Seagate HD.

This guy is so desparate that he is willing to drive out here to Atlanta next weekend if I don't find someone to help him.

So please, those in Houston, look upon this opportunity to help a fellow Atari user, and musician who chose the Atari line. If you can help this person, or know someone who can, please send me email at the address below.

Thanks a bunch

I am not sure that is legal (that is, to send you a copy for a friend).

On the same note, I am trying to find a program that will dump my TOS 2.06
from my MegaSTE to use with STonX on my HP workstation. The dump program
that comes with STonX does not work for me.

If anyone has a program that will dump the TOS image, please let me know.
I have grep'ed through atari.archive for one, but perhaps I missed it.

To: johnmoon@connexus.apana.org.au

Hi there John,

> Cubase will run on a 1meg machine, But.....2 meg is preferable.
> You can run 2.0 from one disk, but 3.0 is a different proposition,
> you should really be using a Hard Disk for it as it is quite large.

Quite right.

> Qbase Audio on the seq side is really qb3.0 it will be to no
> advantage to you unless you have the Yamaha CBXD5 or whatever you want
> to use for digital recording.

The sequencer in Cubase Audio is the same as in Cubase Score and nothing else,
but the rest is true (if you don't aim for a Falcon).

> (Flames galore for this one)I reckon if you want REAL power then go
> the NOTATOR SL route, it's not quite as friendly at first, but after
> you get into it you'll find its a MUVVA****** of a sequencer.

Try to go further - to Logic Audio for Falcon. E-magic haven't been able to
make it work properly yet and I know several cases here in Sweden, when
dissapointed customers have made the shops take Logic Audio back, and after
they bought Cubase Audio instead - everything has worked!

> I use both sequencers, but for me NOTATOR rules.

The sequencer part in Notator/Logic probably works perfectly - I know some
people who have used it for years with no problems at all (in fact, there are
some functions I would want to see in future versions of Cubase),
but when it comes to audio recording - there is only one alternative that's a
realistic choise: Cubase Audio.

Best regards,

Claes

Thanks for the suggestion, but I don't have a joystick plugged
in. It appears that the problem is in my Golden Image mouse. It was
intermittent previously, but now it's consistent, so it's the mouse cable
or something in the mouse itself.

Sadly that is one of 3 PDLs that I wish to have NOTHING to with. If anyone reads
ST Format you hay have seen my response to their outrageous letter which
basically slagged of PDLs that stock full disks at reasonable prices rather than
the empty ones that they stock at 50% more cash. If i was you I wouldn't worry
about it most 3D construction kit games are not too good anyway! Sorry guys.

Those are great conversion programs, but he wants an ST viewer, and neither one does a real good job in that respect. I'd recommend PhotoChrome and Speed of Light. Both use tricks (which he alludes to) to simulate more than the 16 colors normally available.

: manufactured? If so, I'd love to have one.

It was manufactured, and you may obtain one second hand somehow. It is an excellent size and weight, much better than the STacy. It has no built in disc drive though, so you need another ST to transfer files off disc to the Book. The Book comes with software to do this in ROM, and on disc. Also has HD formatting software in ROM. In theory you can plug a Disc Drive into a special port it has, but I'm not sure how.

Good luck!

Sorry, it's broken (again) :-(. I'll try to bring a fixed version soon
(we had lots of trouble with broken HW here in the last few days), but
in the mean time you can use WINX (winx21.lzh for example) to dump TOS 2.06
to disk. It even patches it for you so you can use more windows :-).

The Atari Community E-mail Address Book
Revised 19-Aug-95

Hello all!

This list has been compiled to provide Atarians worldwide with the addresses to contact other members of our ever-changing Atari community. There are 4 distinct sections - user groups, Atari computer contacts, Jaguar and Lynx contacts, and World Wide Web pages. Please note that addresses that are of interest to both Atari computer users AND Jag/Lynx owners will be found in the computer section.

Using this list -
I created this list to encourage communication between Atarians everywhere. If you have a question without an answer, or are moving soon and need to find a new user group, this list should help. It is also a great way to distribute Atari related press releases, such as upcoming Atari shows and new product announcements. And I would LOVE to see user groups sharing newsletter articles via these addresses! However, it SHOULD NOT be used as an advertising tool. If you are a retailer looking to advertise, please contact the individuals on the list and ask if they want to receive your mailings. Some people must pay for their e-mail by the character and would not want unsolicited commercial mailings.

If you have any changes, additions, or suggestions, please contact me via private e-mail. My addresses are listed under AUNT.

Dan Mazurowski, AKA Sir Smedley
Semi-official e-mail contact for AUNT

PS - This list may be printed and distributed at will, though I would like credit for compiling it.

2519. MIDI from ATARI to PC?

Newsgroup: comp.sys.atari.st
Date: 1995-08-19 00:00:00 UTC
From: klefelt@wineasy.se
Message-ID: <8137cb$142a32.36@justnt.wineasy.se>

I need help!

I've written a bloody symphony, hours and hours of music, using Notator on an
ATARI ST at the place I used to work.
Now they've sold the ATARI, and all I've got is my disks.

At home I use CUBASE 2.61.
How do I get the files into my PC?

Is there an emulator somewhere? Do I need to do something to the drive?

Please help me!

Martin

2520. probs w/Falcon/SM124 - HELP!

Newsgroup: comp.sys.atari.st
Date: 1995-08-19 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <JjCC7q-.johnhechtman@delphi.com>
Source record: 160544

This is a repost as the first one got horribly mangled in the upload and I've also gained some information since the original post. But my question still remains - what could cause the "shimmy" I describe and how could it be fixed?

I just recently set up our new (well, almost new) Falcon and hooked it up to our trusty SM124 mono monitor. The good news is that Notator Logic and the Falcon get along great (grin). The bad news is that there seems to be a lot of noise on the SM124 picture. There are also some faintly visible vertical bars on the screen that "shimmy" when any drive is accessed. I got the VGA to SM124 adaptor from Toad and tried the snap-on ferrite bead noise filter that comes with the adaptor, but the problem persists.

My question is, is this normal using the SM124 on the Falcon? I got a less noisy picture with _no_ vertical bars or "shimmy" when it was hooked up to the old 1040STe. Why should I get _worse_ picture quality with the Falcon?

I talked to Steve Cohen of Wizztronics and he said that it might be caused by a bad PSU in the Falcon - he says that anything less then 4.8vdc on the 5v supply indicates a bad PSU and that will pull down the video. Does this sound plausible? I've tried it with _2_ different SM124's and the vertical bars and "shimmy" appear on both. I've also tried relocating the monitor and having it as far away from the cpu as the video cord will reach and I still get the $#@! lines/shimmy! I've also talked to 2 people who have used SM124's or equivalent with the Falcon and they had no problems. I'm a tech and I'll open the Falcon Sunday to have a look at the PSU. What else could cause a symptom such as I describe?

I'd like to hear from anyone who's used the SM124/Falcon combo. Tell me what kind of picture quality to expect. Would a VGA monitor solve the problem? I want to make sure I _have_ a real problem before I start busting the chops of the guy who sold me the Falcon ;)

Thanks in advance to all who reply! It would be especially helpful to direct your information to my Internet address as I am posting this to a number of places to get the broadest possible response. Post replies to: "johnhechtman@delphi.com". And extra thanks to those who already replied, you've helped me make better judgements by sharing your experiences!

> techniques a program used I would be interested in hearing about that.
> I know that STs are not very good for viewing pictures, but many clever
> ways have been thought of which reduce these limitations.

I'd recommend Gemview (shareware) or Imagecopy (commercial) - these are both great pieces of software.

Best regards,

Claes

Are you using an ST/e? I've heard NVDI is faster than Warp9 on Falcon, dunno
about the TT, but apperently Warp9 is faster when used on an ST/e...

Arrgh! He was saying Warp9 only* speeds up text. If that is true, then where is

this 200%-400% increase in graphics speed comeing from? (I'm using a 520STfm upgraded to 1mb in medium resolution) Anyway, this is getting stupid, into the killfile this thread goes...

Speed of Light is great for all-around use, it uses a flickerdraw mode that extends how many color are displayed. Photochrome uses a lot better looking flickerdraw variant, but its handleing of pics smaller than 320x200 is buggy, its a lot slower than SoL, and it doesn't allow you to scroll around pictures larger than the screen in real time like SoL does.

Latest Speed of Light: 3.8
Latest Photochrome: 4.0, last I heard

It's not a Falcon ST/e thing. It's Falcon-MODES vs. ST/e-MODES. Warp 9 was written for the ST/e, and support for Falcon modes was almost an afterthought, so Warp 9 does it's best work on ST/e modes. But that also applies to ST/e modes on a Falcon (and presumably a TT).

CL> does.

If you convert those >320x200 pics with RAW2RAW first, it will handle them just fine, as RAW2RAW will create a 320x200 pic with equal black borders.

RAW2RAW is also good for larger pics, because it gives you even scaling, something not available in PhotoChrome (unless the pic is evenly divisible by 320x200). Even 640x480 pics look better when even scaled.

The only drawback is it only offers 2x reduction, so on pics larger than 640x400 you only get the top left 640x400. So on a 640x480 pic you lose the bottome 80 lines. (Of course, you can use Speed of Light or some other utility to to clip the image first.)

tl> Converting them is another story.

What do you mean by that? Speed of Light converts JPEGs just fine here. It screwed some of them up on older versions, but recent versions (the latest and probably last is 3.8) do a fantastic job of converting them.

Get your facts right. L.A.P.D. never slagged off other PDL's that stock full disks. Most of the L.A.P.D. disks are full, and some of those that are not are that way because L.A.P.D. talk to authors and it is the authors wish that their work is not 'bundled'.
What L.A.P.D. actually objected too was some of the compilation disks distributed by other libraries where an author's work is abused. Firstly, with licenceware programs being included (which are not PD) and secondly with text files being removed presumably to save space on the disks.
Compilation groups seem to think that because a program is in the 'public domain' they can do what they want with it. That is not the case, the author still has rights. If L.A.P.D. annoy you because they defend those rights on behalf of the authors, then tough. They'll annoy you a lot more in the future if you continue posting misinformation.
Finally, if anyone wants a copy of RAMWORLD 2 then send a blank disk and a s.s.a.e. to L.A.P.D., PO BOX 2, HEANOR, DERBYSHIRE, DE75 7YP and we'll send you one at no extra cost.

Frank, are you saying there is a SCSI timing problem that can not be
resolved with the F08N/F04N timing mod? I do have timing problems
with my Mighty Sonic and SCSI port, and this subject caught my eye.
I have talked to Don Maple about this, but as of late he does not
respond.

So does STonX work with Winx? Cool! Which brings me to another question...

Well, I've been hearing neat things about Winx, so I downloaded v2.2. The docs say that with TOS 1.0 you can just throw it in your Auto folder, so I did. Well, it booted up, and as it got to Winx, two little bombs appeared and it continued booting, no change to GEM. Well, just for the heck of it I stuck GEMRAM in front of Winx, this time two bombs for GEMREM, two for Winx. So I assume Winx & GEMRAM don't like US TOS versions? Grrrr....

>
> Please help me!

Try this:

Stick the ST disk in your PC, and try to access it. (flip the write protect tab

if your paranoid) If it works, hurray!, if it doesn't, then it gets
complicated.
You can try getting a small program to modify the disk to allow you to
use it on the PC, but this won't work if you've done any fancy formatting with
the disk. If you have* formatted the disk with one of those 800k (or more)
formats, then ya have to fool with your CONFIG.SYS file...

Yea, these are great for converting, and viewing on Falcons & fancy video
cards and such, but we're talking about a stock ST! Speed of Light and
Photochrome do neat-o tricks to extend the number of colors displayed...

TAR1112 handles minix partitions. I believe that's the version name at least you can find it on any archive that has a good Mint section. I believe it's under utils on a.a.u.e. Although I'm not 100% certain about that. I am certain that it's in the Mint section.

I do believe this is now the case, the author of my BBS software is a
co-founder of Freeze Dried Software and Aaron has passed sources of some of
his products to him (Freezedried Full Screen Editor / Freezedried chat) to
use in the BBS.

Freeze Dried Term is not supported, despite the "new" hope of v3.0 that
were circulating last year... unfortunate, but true.

Once you have a (working - many thanks Jos ;-) script it is fully automatic.
No need to learn anything but to log in, type 'post' (in my case) and
uploading replies, collecting mail & news, zipping it and downloading it
is all automatically done for me.

[snipped stuff about providers and their respective speeds]

Yes, of course, that is precisely how it works, you figured that out ;-)

Well, I am unable to test it as I am still impatiently awaiting my ZIP-drive
I ordered over two months ago, but my distributor tells me that it works
absolutely fine with most newer harddiskdrivers. Maybe someone who owns a
ZIP-drive in the US (or so) can substantiate this ? In europe there is a
huge delay shipping the drives apparently...

I need some advice on fixing my Falcon's keyboard. The $85 replacement is NOT an option, since I simply don't have the money to waste.

What's happening is that keys, especially the 'E' key, simply don't respond some times when I press them. I have had the keyboard apart a few times since it started dying on me, trying to fix individual keys. Recently, I discovered that the cup for the E key was torn up. So what I did was sew (with needle and thread) the cup back together, and then switched it with the cup for th Clr/Home key. Ironically, the Clr/Home key works just fine, while the 'E' key with the new cup is not functioning properly. Plus, I am having problems with other keys not responding properly either.

Now, I can either try to fix the problem, if anyone has any suggestions, or I can replace the keyboard from one in a 1040 that has since died with a salvageable keyboard.

Please respond to me in email at millert@grad.csee.usf.edu, because if you post to the newsgroup, I will NOT get your reply.

Thank you.

I've had a CRPG put onto atari.archive.umich.edu. Look for anoraks.txt,
anoraks1.lzh and anoraks2.lzh if you are interested.
It should be playable on ST/STe with anything above 512K and one disk drive.
It's got all the standard stuff (except possibly creativity), but is really
a testbed for a game designer I have written, and I would appreciate feedback
on what else I should put in and whether anybody would be interested in the
game designer.

Your best bets for "Viewing" Gif's are Speed of Light and
Photochrome, with Photochrome having a decided edge in display, but
choking on some Gif's and not liking the Cache in the AdspeedSTe
(timing is critical). For Jpg files Speed of light gives the best
display and works with the AdSpeed STe at 16mhz!
Converting them is another story.

2565. Monitor and Disk Drive For Sale

Newsgroup: comp.sys.atari.st
Date: 1995-08-20 00:00:00 UTC
From: cburns@mail2.sas.upenn.edu
Message-ID: <4166q1$j1a@netnews.upenn.edu>
Source record: 160480

Atari ST monitor model number SC1224 and disk drive model number SF534
(3.5") for sale.

Best offer. We are in Brooklyn, and would prefer not to ship this, so if
you're in the NYC area, either Email us at natalia@bway.net (different
address from above) or call (718) 768-3015.

Also, a box full of 3.5" disks full of software will be included.

We need to get rid of this hardware. The CPU is long since dead and
gone, and the monitor box is now only taking up space in our apartment.

Thanks,
Charles and Natalia.

For .GIF I'm using Watch-it; very nice, fast, uses Gem.
For .JPG I'm using 1ST-guide (does MPEG etc. etc. too).
Unless you own a falcon, these are the programs to go for.
Also worth checking out are Speed of Light and Gemview.
Gemview is not as fast as the others but offers a lot of additional
features and can read almost any existing picture-format known to mankind.
Speed of Light is _very_ fast, I believe the fastest available, but is
unsuited for _my_ purpose because it doesn't use a window.
If you are solely using ST resolutions (I'm using a graphic card) there
are many, many more viewers available.
For ST's I heard photochrome is good, but I have never used it so I
cannot comment on that.

>
>Andy.

IMHO, the ZIP-Drive may be the _best_ product available since a few
years. I see it as the floppydisk of the future (...).
What makes you think the syquest EZ are a better deal ?
I, for once, am a bit scared by all the 270 MB drives that have problems.
I don't know Syquest fixed that yet, possibly they did.
Anyway, I think Syquest was *forced* to market the EZ drive due to the
introduction of the ZIP drive and I'm not sure they weren't forced to
market a drive they haven't finished yet, at a premature date.
I go for the ZIP-Drive.

On a similar note:
What is it that makes people so damn unsatisfied with what they've got ?
The ZIP-drive is barely there and already I see posts in this group asking
why the JAZ-drive isn't there yet.
It can never be enough for you can it ?
The ZIP-drive is a great product. When another drive from Iomega sees the
light, let's deal with it when it's there, not beforehand.

>(SCSI interfaces often have an ID of 7)." So who is more likely to be right-The
>manufacturers or a bloke with a Megafile?

Sorry to disagree with you _again_ ;) : I am.

I'm not just a bloke with a Megafile. I have used and serviced almost all
known harddrives available to Atari users and, for instance, know the books
'Scheibenkleister 2' and the 'Atari Profibuch' by heart.

I've been an Atari dealer/repaircenter for about six years now, and know all
the ins and outs of Atari equipment, so if you _are_ quoting from a Hisoft
manual, *they* should get their facts straight 'real soon now', or you
should try and read better.

Whether it's ACSI/DMA or SCSI makes no difference; the *Computer*
should be the 'hostadapter' and have an ID.
As the ASCI-bus doesn't support this hostadapter-ID, this was never used.

The hostadapters for Atari as we know them are not true hostadapters,
but only 'translate' the ACSI commands to SCSI commands.
So a SCSI ID nr. 3 *will* be conflicting with an ACSI ID nr. 3, 'cause
they're the same.
(exept for the TT of course as it has separate ACSI- and SCSI- buses.)
And, as stated, they have _NO_ ID number !

This goes for all hostadapters known to me, including all ICD ADSCSI
series & LINK adapters, adapters by GE-Soft, Hard&soft, HDP, etc.
If you don't believe me, try all ID's 0 trough 7 on your own harddrive.
You'll see it will work fine at all 8 numbers.
Or run IDCHECK.PRG ; Harddisks, yes, but NO Hostadapter ID's...
The Falcon and TT do have ID numbers, Link's and other hostadapters do not.

Maybe the really new hostadapters sporting SCSI-arbitration do, I don't
know yet, but that's a very small part of all available LINK's anyhow
and not relevant in this case, being the problem of the original poster.

Regards,

The keys are connected through a matrix; if you also have trouble with
S, X, D, W, 3, 2, F5 (column) or [control], Q, T, G, I, P, etc. (row)
(some or all keys) possibly a trace on the PCB is broken (or a wire)

So I guess you'll never read it, eh ? What a waste of bandwidth this is
reply then... :-(

Sorry, if _you_ can't take the time to read a newsgroup after you ask a
question there _I_ can't be bothered to take the effort and write you a
reply. Don't you think time is precious to us all ? Huh ?
If you ask a question at least be so polite as to read your answers at
the place you asked in the first place.

In a message of 19 Aug 95 Carl Hender wrote ...
CH> I've just got hold of v1.20 of Oasis but I'm having problems getting
CH> it to run on my Falcon I get an error026 when I start.

Further to my previous message I started suffering this!!!

But... It's caused by any network news postings not having a blank line as
the third line.
If you have this ([end] being last character)

<808919280_OASIS_@cnserv.dungeon.com>
dungeon.test[end]

Instead of

<808919280_OASIS_@cnserv.dungeon.com>
dungeon.test
[end]

You will get the "ERROR 026" message followed (in my case) by a TOS error
-230!

Source record: 160487

Hi,

I have downloaded Junior Office v2.01 from a local BBS and would like to try it out, but unfortunately, all the docs are in German, which I cannot understand.

I have been told that the latest versions of Jr Office come with English docs.

Does anyone have the latest version and could e-mail the english docs to me please ?

I know that any such docs will refer to features not found in v2.01, but I'm sure that a great deal of it *will* be applicable.

Many thanks in advance,

Cheers,

Kev.

LAPD are one of *the* most professional outfits I've dealt with. I just recently spent a day in their offices, and they run a *very* professional setup and don't make a profit. You're obviously entitled to your opinion Paul, but publicly sounding off about them isn't nice. The letter you're referring to wasn't only from LAPD - it was also co-signed by Mike Goodman from Goodman Enterprises. I suppose you're telling me Goodman are an outfit you wouldn't deal with, for the same reasons?

The letter was about PDLs who produce packed 'compilation' disks, stripping out document files, and often leaving phone numbers etc. in there for the original library they bought the disks from. LAPD have had problems with this, as the buyer somes back to them when files are missing from the disks.

Believe me, you won't find many libraries which are willing to provide telephone support like LAPD do.

Cheers,
Frank.

DB> is network fees for linking into the network itself. With
DB> NeST no such fees exist, as each member works freely to
DB> gain the best connections, minimising mail costs as much as

DB> possible.

How about Internet?? Would be nice if it is possible since I can FTP
over and grab the mail packets directly off the FTP server and
send the replies back the same way.. Fidonet backbone mail and filebone
are achieved this way now on some boards and I am also moving to this
direction as I have a permanent internet connection..

DB>
DB> Daron Brewood - 90:90/0.0@nest.ftn
DB> - dbrewood@nest.demon.co.uk
DB> - dbrewood@cix.compulink.co.uk
DB>
DB> I look forward to hearing from you...
DB>

Btw, I am still a NeST node I hope, but ofcourse, the cost of calling
long distance for the mail halted me in getting further echoes for NeST..
If you have Internet support, then I would start immediately to import
those echoes back again. :)

: I can't, for the world, understand why people would want to use
: SLIP/PPP for mail and news.

It's quite simple actually, by having your own slip account all mail
etc goes directly into your machine for later offline reading.
I think all our English friends are in the unfortunate position
of having timed local calls, and as well as having to pay X amount
of pounds for each hour they are online. They can just download
what they want very quickly and then logoff. It's a bit different
here in Australia we have a VERY large nationwide public access network
that has only one yearly charge and NO timed local calls.

: SLIP/PPP _only_ makes sense if you want to
: use a graphical Web browser. I mean, the whole silly business is so
: theeth-grindingly slow, it's unbelievable.

Absolutely true, but unfortunately a lot of people are not able/willing
to learn a bit of unix so that they can run a shell account. The slip/ppp
thing is a very simple point and click affair and i think most people
would rather put up with a bit of speed degradation and get surfing
than have to worry about learning a completely new and user unfriendly
operating system.

: And anyhow, it is plain
: silly to use your own computer as a node in the net, since the
: machines of most providers - and you normally have access to them -
: are very powerful and fast Unix machines.

That's crap..... I have three separate net accounts with three separate
providors. One is with a university (so you can imagine the size of the
mainframes!), the other 2 are with public access providors. One of
the PA providors runs his system on a Pentium and the one that i am
on at the moment just runs a 486.

The slowest is the Pentium, and the 486 and the Uni speed differences are
absolutely negligble. It all depends on how they are set up......

: And what's more: There exists an excellent offline mail and news
: reader for the Atari which can handle SOUP packets. And it has been
: around for years. It is a GEM program at that, very versatile, very

You can use the Unix uqwk to upload and d/l packets anyway.

AC> adjusting the SM124?

There is a text file around which describes how to do this, I'm afraid I've forgotten its name.

Anyway, if you open up the 124 you will find that the presets are well labelled and you should have no trouble finding the width and height controls.

If I remember rightly the height is adjusted by turning the core of a RF transformer. The one one mine was jammed solid and I was afraid of cracking the core so stopped. I'm not sure of the best way to unstick these cores but I was going to give it a drop of easing oil next time I went inside. Anyone got any better methods.

When you are doing the adjustments make sure you have a display of a true square available so that you can get the aspect ratio right.

After getting the shape right you will prob need to tweak the H and V holds to get best image stability.

Unless you have a meter, DON'T adjust the preset B-ADJ (or something like that). It changes the DC levels from the switched mode PSU and could seriously compromise the life of components!

Dear All,
I work in the video industry, and run an Amiga 2000 to do graphics and assorted video editing. Now I hear that some people use the Atari 16 bit computers to edit video (some system called the 'Falcon' or something like that) and that these machines are still being made and could be bought new (an advantage over the Amiga). If anyone out there can help me out and explain what system does this, can I get it new, what extras would I have to buy, and about how much would it cost, I would be greatly appreciative. -Jason-

To truly run Atari software on a PC, look for GEMULATOR from Branch
Always (Darek Mihoka). This has recently been upgraded to version 4.0 and
consists of a hardware board (with TOS 2.06) and software. The version 4
software is 32-bit application (meaning for WfW 3.11 you will need to
install WIN32S).

The beauty of this version is that you now have access to all of the
hardware hooked to the PC - local or networked. Also floppy drive access
is MUCH better than the previous incarnation of Gemulator (v3.02).

>bunch of files from a load of disks (both single and double)
>
>Where kind I find a suitable program?

If all you wish to do is read your Atari disks on a PC, you do not need
an emulators, since PCs have been able to read Atari disks since day
one. They use the exact same disk format, except that TOS 1.0 and TOS
1.2
didn't quite get it right. All you need to do is run one of probably
dozens of public domain and shareware disk utilities on the Atari ST
that a fixes the format of your disk, and then the disk is readable on
almost any PC. Note that some PCs can't handle the 10 sector 800K or
11 sector formats, so try to keep your disks in the standard 720K
format.

You can download one such utility from our web page. If you do really
want an Atari ST emulator for your PC, our web page gives you
information on the Gemulator as well. The web page is at:

http://www.halcyon.com/brasoft/

and you want to check out the Gemulator 4.0 page and the Free Downloads
page.

: should still be around, if he's not in jail for fraud <g> =)

Well Hopkins no longer supports FZDT and he has other people's money
that he has not returned. I suggest that you contact the U.K.
distributor BEN VAN BOKKEM he is extremely reliable but I dont know
if he is still handling the program. His number is.....
+44 296395935 (INTERNET BBS).

I just wish Hopkins had have hung around for one more last revision
just to get it up to vt100/101/102 emulation, if it had made it that
far then Connect, Stalker etc would not have been in the race.

2593. 16-Bit Stereo Sample Sequencing/Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-08-21 00:00:00 UTC
From: ba186@freenet.buffalo.edu
Message-ID: <DDo47C.F7q@freenet.buffalo.edu>
Source record: 160358

For anyone with a Falcon: Are there at least 4-Track 16-Bit Stereo Sample Sequencers out for the Falcon? I want to play with samples, not so much MIDI stuff (not yet) and need at least 4-tracks minimum to sequence 16-Bit Stereo samples. Right now, I am using a 1040STe w/4MB and a Stereo 16 Replay cartridge. This configuration works fine for me, but the problems occur when I want to sequence samples. I have not found a sequencer/ tracker that will handle 16-Bit Stereo Sound and play through the Replay cartridge. I know the Breakthru programs do this, up to 4-tracks, but it is kind of expensive and limited when I am guessing a Falcon can handle at least 4-Tracks and probably more (Breakthru is 4-Tracks only for samples) and hopefully has direct-to-disk recording, which I can make use of for remixing. I'd obviously like to stay on my 1040STe, so any help with either maching would be appreciated. Thanks,

Theron

: if i run Mtos it doesn't give the message but still doesn't work.

: I have a TOS 4.01 Falcon. Can someone explain to me what i'm doing
: wrong or mail me a working setup that i could use.

I had somewhat the same problem with my TT. Running just the SCC driver
after DRVIN would make CoNnect unable to set the bps rate on Serial 2,
and would also make it think that Modem 1 and Serial 1 had disappeared.
Anyway, I was able to fix the problem by running ST_MFP just before SCC.
I don't know why it worked, but it did to my satisfaction. I think Modem
2 is still gone, but Serial 2 works, so I don't really care <g>

: more than mess somebodies falcon. The harmonics of the CB frequencies
: tend to sneak out easily and would land in the aircraft bands quite
: noisily.

Nope, the FCC only responds to complaints based on overpowered transmissions on "free" bands. They do not monitor CB, as CB does not require a license. If the FCC receives enough complaints to warrant a triangulation search, then they will apoply resources to do it.

Besides, people transmitting on CB with lots of power tend to use unusual antenna setups (like miles of barbed wire or chain-linked fences). Which make triangulation impossible, as the signal comes from all over instead of one location.

Also, it is most likely the FBI, or Federal Marshalls, would be the enforcement agency to confiscate the equipment, as the rules are Federal. The local Sheriff would be asked to assist.

I have the following equipment for sale

520ST
360Kb SS Disk Drive
Monochrome Monitor
Mouse

All of the above are in good working order

In addition, I have a 1040ST that works, but has a bad video driver chip.

If you are interested, I want to sell the whole pile. Please
e-mail me an offer. If you're the high bid, I'll pay shipping
and send it COD.

Thanks,

Well that's a reccomendation of sorts! - Writing lottery programs isn't exactly a money spinner either - But then you have to program with your Heart and not your Head these days - Especially for Atari!

All the best in OZ - Bet it's hotter over here!

The ICD INC. Company has been the only ones to provide a beta release of
a driver for using the Iomega ZIP drive for any of the Atari computers.
According to others, this is not quite stable yet. If you are fortunate
to have a TT or Falcon, then all you will need to (try to) use a ZIP will
be this software. All other models will require an ICD LINK unit and be
able to modify a connection to the ZIP to provide termination power.
Due to limitations of the ZIP's SCSI unit address (only two numbers) and
that it is more of a 'floptical' than a real hard drive - Syquest's
response with the EZ135 seems more to anyone else's liking (doesn't have
those limitations).

>here in Australia we have a VERY large nationwide public access network
>that has only one yearly charge and NO timed local calls.

You're begging the question. My complaint precisely was that SLIP/PPP
is so SLOW.

>Absolutely true, but unfortunately a lot of people are not able/willing
>to learn a bit of unix so that they can run a shell account.

The Unix you have to learn is absolutely minimal and there are loads
of ready-to-run scripts widely available on the net.

>The slip/ppp
>thing is a very simple point and click affair

Very simple indeed! Most programs to run SLIP/PPP require
configuration files - ever thought about that? It took me three days
to get NOS up and running and I see people asking questions on the net
about the damn thing almost daily.

>and i think most people
>would rather put up with a bit of speed degradation

You still don't understand. It's not _a bit_ of speed degradation,
it's _a fantastic amount_!

>That's crap..... I have three separate net accounts with three separate
>providors. One is with a university (so you can imagine the size of the
>mainframes!), the other 2 are with public access providors. One of
>the PA providors runs his system on a Pentium and the one that i am
>on at the moment just runs a 486.

A 486 with Unix is a very fast machine. But anyway, most providers
will have more powerful machines and there are simply no modems or
SLIP/PPP protocols which can beat the compression power of archive
programs like zip or lharc. And that is to name only one of the
aspects of the case.

>The slowest is the Pentium, and the 486 and the Uni speed differences are
>absolutely negligble.

But you use SLIP/PPP, don't you? So how would you notice the speed
difference?

>You can use the Unix uqwk to upload and d/l packets anyway.

Wrong: uqwk is used to _collect_ and _send_ mail on Unix machines. It
is not a stand-alone program, it uses sendmail and inews, for
instance. It is the program most widely used to create SOUP packets.

DUMMMYS DUMMYS DUMMYS.............

The reason why the core seems to be stuck is 'YOU CRACKED IT', it only should get adjusted with the proper little tool called a trimmer, and since n ot to many people have these little tools it usually gets done with a screw driver.

The other thing that happens when you adjust the height by making this adjustment is that you burn out the fly-back transformer, should be obvious in about 6 months to a year so don't come and tell me mine seems to work fine, if it actually is working fine there is only one word for that 'LUCKY'.

So leave the adjustments alone!!

Date: 1995-08-21 00:00:00 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <809037404_OASIS_@yeadontt.demon.co.uk>
Source record: 160372

As of Monday 21/8/95 OASIS 1.30E has been uploaded to the Demon and Hensa
FTP sites.

Two files have been uploaded.

OASIS130.TOS is a complete version of OASIS for people who have either
never installed OASIS before or who have a version of OASIS below 1.20E.

UPD_130.TOS is the files that have changed from version 1.20E for those
who have already installed 1.20E.

Yes, I have a copy of that text file (but I'm not at my main desk right now
I'll upload it soon). There is also a small share/prog which displays
squares, parallel lines, etc. for adjusting the monitor. I've done the
adjustments many times. The first time was pretty nerve-wracking, because
there are components there which can fry you! At least, invest in a set of
plastic-handled adjusting tools.
You may find, as I did, that there is a reason for the border; the full-
out screen is subject to warping at the edges, and the focus is a
compromise between center in focus, or edge in focus--you can't have both.
So, after tweaking around a dozen SM124's, I ended up setting most of
them back close to factory specs. I prefer the look of the screen slightly
stretched vertically, although that means I have to calibrate my picture
boxes when doing DTP.

Funny!

SEMPER will not run UNLESS it has HSMODEM.

Connect has its own serial port handler and is not dependent on HSMODEM.

I have STM TOS1.04 + MagiC, always load HSMODEM and can run SEMPER, Vanterm
and Connect with no probs.

>

The company behind this never came through with the product, and some
people who put down money in advance allegedly never got their money back.

This is still a product that I would be interested in. I am tempted to buy
a LaserJet, but I would lose so much speed that it seems a pity.

Doesn't SCSI contain DMA features? Why can't something be arranged with
this? Also, why aren't there cheap SCSI printers on the market? They
would provide a much greater speed/cost ratio.

Sigh.

In what way? Are any of these over priced Falcon clones available in the U.S.
that are competitve to a $1699 PowerComputing 100(601-100mhz)?

Try Uniterm if you haven't already. Always been my favourite.
Though I'm not sure what you mean by `A GEM interface' if you don't want
the term in a window. I guess Uniterm sort-of fits the bill - No window,
but all the configuration is done via dialogue boxes.

Jim:

PC's have trouble with extended formats due to either the version of DOS or BIOS version they're using. Theoretically, they should work fine but often one needs to load in a TSR or device drive that patches the DOS and BIOS disk tables so PCs can access the extra sectors and tracks.

Also, be aware that many PC clones have really shitty disk mechanisms that can't always reliably read more than 80 disk tracks whereas almost all ST drives can go to 82 tracks w/o problems.

Re. the adjustments......

As for it being a older used model I get your point, to adjust it to a larger screen size still means that you need to bring up the voltage with the result that you will likely fry something, if you want it to last bring it to a shop where they can do this properly.

To draw a parralel, if you have an old car and wnat to replace the engine for a better stronger one but do not change the transmission the next thing you are likely to have problems with is the transmission or the rear-end, the same holds true for Monitors.

By the way, the screen size on a Hi-res monitor is positioned more in from the side then that of a Mid-res monitor.

I didn't say everyone using the ST for serious work. I simply said more people use ST Medium than any other resolution. At least that's the way it is in the U.S., based on my years of observation. It may be different in Europe.

PS> And if you don't use your ST for serious work, you have no need for
PS> neither Warp 9 or NVDI so why bother comparing?

I don't know how you define "serious work," but I think anyone using an ST for anything other than games would be well served by buying either NVDI or Warp 9.

PS> I own both and Warp 9 aren't that bad but it's had its day. It's like

Let's not turn this into a My Program/Country is Better Than Your Program/Country. The original point of this thread was that according to GEM Bench, Warp 9 is faster in ST Medium, and you've said nothing to dispute that.

* LED v1.30 * ST: The Next Generation -> Falcon030

Let me repeat my original post. I got the monitor used and it is
obviously way out of adjustment. I'd just like to return it to factory
specs. Besides, monitor picture geometry DOES change with age. What are
you supposed to do then? Isn't that what the adjustment pots are for?

>
>So leave the adjustments alone!!

See above: so, what do you suggest I do with an SM124 whose scanned area
is 2" from the CRT frame on all four sides? Is there something else
wrong with it besides?

I can use 820K disks on the PC with *NO* hassle at all!! The only thing you have
to make sure of is that the disk is formatted with *NO* interleve.

The PC is real crap in this area because is EXPECTS the sectos to be in order
when it reads them!! Poor coding...

WHAT? Why do people think that because you cant format 10 sectors from DOS the PC cant handle it?!?!?

As long as the disk is *NOT* and interleved format the PC can handle 10 sector disks just as easily as 9.

AFAIK the pinouts are supposed to be the same.

I've tried it now anyway - and it does work!

I've only done a few grabs but the VIDIST12 does seem to work fine on the
TT. I have my one plugged in at the moment and it causes no interferance
with the normal working of the TT either - least AFAICS.

> RG> 69.99ukp. They can be picked up 2nd hand for 30-40ukp however.

The binaries will be in there somewhere - just that like true UNIX programs
they have no filename extensions. Look for some large files.

Having said that - If you are completly new to UNIX type systems - then
MiNT-Net is pretty hard to install.

Its worth it though IMHO.

:-)

>be this software.

If you say so... However this strikes me as very odd, comparable drives
(also SCSI, also removable) like the MO drives and Syquests do not need
any special software. I mean, formatting and partitioning a SCSI device
should be possible with all software on _any_ drive. What makes the
ZIP-drive so special that it needs special software ? Any ideas ?

BTW do you use a ZIP-drive yourself or are you just quoting information ?
Because, as stated in the first post, I have information too, that says
it works without any need for new driversoftware...
Too many unsubstantiated rumours are around right now. (yes, mine too ;-)

>All other models will require an ICD LINK unit and be
>able to modify a connection to the ZIP to provide termination power.

I know, but I trust myself in _that_ department, easily done. ;)

>Due to limitations of the ZIP's SCSI unit address (only two numbers) and

That's enough provided these are not numbers 0 and 1. It's 5 and 6 IIRC...

>that it is more of a 'floptical' than a real hard drive - Syquest's
>response with the EZ135 seems more to anyone else's liking (doesn't have
>those limitations).

Ok, but the latest I've seen of Syquest, notably the 270, is quite prone
to malfunctions IMHO (at least some units, or was that a firmwareproblem ?)

What's the price of the cartridges for the EZ135 ? $ per MB counts for me.
And is it shipping yet or just announced (vapourware / longwaitware) ?

I don't know if what I have will fill your need - but - I have a dead Megafile 20 HD with a _working_ power supply in it. The problem is with the HD itself. I'll sell you the whole thing for $20 _plus_ shipping. Brad at Best Electronics is selling 20 meg drives for about $20! So you could likely fix it or just use the PSU which is the only part I can say for sure works (I tested it). Good luck!

>My guess is there are more people using ST Medium than any other Atari
>resolution, including ST High.

Forgive me but I find that very hard to believe. Anyone using the ST for
serious work is bound to be working in high-res, or go crazy trying.

And if you don't use your ST for serious work, you have no need for neither
Warp 9 or NVDI so why bother comparing?

I own both and Warp 9 aren't that bad but it's had its day. It's like
comparing LGSelect to Selectric. Game, set and match to the Germans.

And it's no coincidence either, since nearly all state-of-the-art programs
have emerged from Germany. They're awfully talented programmers.

Perhaps Microsoft could learn something from them? It might help them produce
a useable operating system before the end of this decade. :-)

2635. HSMODEM

Newsgroup: comp.sys.atari.st
Date: 1995-08-21 00:00:00 UTC
From: aford@t-ph.demon.co.uk
Message-ID: <808963636_OASIS_@t-ph.demon.co.uk>
Source record: 160436

What am i doing wrong with Hsmodem ?

None of my comms programs work after running DRVIN and SCC .
Connect gives me a message that it can't find device U:\DEV\MODEM1
if i run Mtos it doesn't give the message but still doesn't work.

I have a TOS 4.01 Falcon. Can someone explain to me what i'm doing
wrong or mail me a working setup that i could use.

cheers
Andy

: whole is a bit a a con - i.e. we buy the tickets and some opera that
: most of us will never see gets x-million pounds.
: You will get approx 24% of your stake back.

We've had State-run lotteries for decades here in Oz (invented the things, I'm told) and they're treated in the right way by most people I know: A cheap form of entertainment where, for a quid or two, you get to spend hours dreaming of what you'd do with all that money!

It's only sad when you see people spending money they don't have to spare, really expecting to win.

Other than that, lotteries are considered to be gambling for the statistically impaired or a tax on stupidity!

(Sorry Mark; guess I won't be registering your program! There's others written here and in the States for similar purposes, but yours seems far more complete than most.)

From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <5ZDirsz.johnhechtman@delphi.com>
Source record: 160438

Since my last post I checked the PSU and found the 5vdc fine at 5.03v, but the 12vdc is a tad low at 11.39v. Could this be a cause of the problem? I also hooked the Falcon up to a friend's SVGA and all looked swell. No lines or shimmy. However _many_ folks have said this is not normal for a Falcon/SM124 combo. So it seems I have a sick bird :(:(Now can anyone help me further with a fix? Thanks to all who answer!

2639. Emulate ATARI ST on the PC?

Newsgroup: comp.sys.atari.st
Date: 1995-08-21 00:00:00 UTC
From: klefelt@wineasy.se
Message-ID: <8157cb$9319.310@justnt.wineasy.se>
Source record: 160440

Noone seems to know where to find an ATARI emulator for the PC. One that will let me read my ATARI disks in the PC's 1.44 drive.
And I do believe the disks where formatted with TOS 1.2 (the ATARI I was using was kind of old), but then I'm not an ATARI user. I just want to transfer a bunch of files from a load of disks (both single and double)

Where kind I find a suitable program?

Martin

: reply. Don't you think time is precious to us all ? Huh ?
: If you ask a question at least be so polite as to read your answers at
: the place you asked in the first place.

Oh pull that crowbar out of your ass. If you woud have looked at the return address, then you would have noticed that it comes from a university. How many times have yu found yourself able to spend lots of time searching through news articles every day in hopes of finding what you need and have time for school-work?? It's much easier to check to see if you have mail and immediately print it out and get on with your busy day.

Besides, if you would have read his entire message BEFORE forwarding to a Newsgroup, then your reply would have been MAILed, because you would have known you needed to send an Email REPLY.

Geez!

Rich

As I now own a Mac and ATARI, and have to work on PCs at the university I
wrote the program EXchange (for all ATARIs) to convert MAC, DOS, Windows
and ATARI text into each other.

The program will be available soon on ftp, but if you need it urgently
I could mail it to you.

Hello all.

I have a 1040ste I must part with. It has the following:

2mb ram (Dealer installed)
20mb external shoe box HD
external 3.5" diskette drive (= two drives)
LOTs of software including Calamus and many games
joysticks
books and magazines
THE WORKS!
all in great condition

I'm asking $400 for it all or any reasonable offer.
Please note me at
seward@magicnet.net

2646. Q: info on ICD AdSCSI Plus board?

Newsgroup: comp.sys.atari.st
Date: 1995-08-21 00:00:00 UTC
From: psu01223@odin.cc.pdx.edu
Message-ID: <4193q4$kd5@odin.cc.pdx.edu>
Source record: 160447

Hello everybody. I've acquired an ICD AdSCSI Plus board without docs or disks, can anybody give me some info on it?

It looks like I should be able to just run a ribbon cable from the SCSI connector on the board to a hard drive--is it that easy? Can I daisy-chain SCSI devices with this board, or can it only control one?

Do I need any kind of driver software or anything? (This is my first ST hard drive experience, so forgive the dumb questions. 8-)

Thanks,
Alex

>and a rumor said that they try to by the TOS 4.x ??

>Do you have more informations ?

Huh?? Latest I heard here was that Wizz flushed the Barracude
project. It seems _very_ hard to make a 68040 card - I've heard some
rumours about the Afterburner, and even seen an official GE-Soft ad,
but it seems not to be for sale yet. When did Wizztronic say this?

Isn't there a 68060 card for Amigas called the Drago or something?
And can't we just use 030->040 upgrade cards for Macs? Strange.

Regards,

From: Ari Feldman <ari2550@delphi.com>
Message-ID: <B1CjT7a.ari2550@delphi.com>
Source record: 160252

Jim:

You are lucky that your drive can handle 84 tracks - you're the exception to the rule. IBM & Microsoft physically limit you to 80 normally because there are literally hundreds of different drives available and in use while on the Atari most were one particular brand or a small number of brands with consistent support for 82 tracks.

PCs do suck but they are cheap and offer good performance for the $. Macs are better - I now have a PowerPC w/40 megs of RAM on my desk at work and life is good but it would bankrupt me to buy one.

PCs are the future even though the architechture sucks... :(

Ari

Hullo.

I know this is almost a week late but I also saw an ST-book laptop. I saw one in downtown Toronto (canada) back in the summer of 1992 or1993 I beleive. It wasn't a flyer but an actual working ST-book on display in a computer store, it was in the same price range as a TT030. I was brok then (and still am now), but dognammit if I had the money then I would have grabbed it, I could sure use it now!

|
|| PC's have trouble with extended formats due to either the version of DOS
|| or BIOS version they're using. Theoretically, they should work fine but
|| often one needs to load in a TSR or device drive that patches the DOS and
|| BIOS disk tables so PCs can access the extra sectors and tracks.
|
|Well, I've had no problems on ANY PC i've used...
Then would you please enlighten us? My pc requires a special program
just to access my ST disks tos 1.0-1.62 various formats including
standard...
|
|| Also, be aware that many PC clones have really shitty disk mechanisms that
|| can't always reliably read more than 80 disk tracks whereas almost all
|| ST drives can go to 82 tracks w/o problems.
The disk mechanisms are identical, at least no less shitty than
those put into ST's.
|
|Hmmm... My ST drive can handle 82 tracks, my PC drive can handle 84. PC's
|are crap, aren't they?
Horribly inconsistent...

2659. Re: MIDI from ATARI to PC?

Newsgroup: comp.sys.atari.st
Date: 1995-08-22 00:00:00 UTC
From: edderoos <eddy.deroos@rug.ac.be>
Message-ID: <41djq5$mla@infoserv.rug.ac.be>
Source record: 160260

normally, there should be no problem loading a song written on
an older version of Cubase into an update, even on PC.
Anyway, you can always convert your song into a MIDI file and
load it into Cubase for windows.In this case, look for someone
who still works on ATARI for the conversion.
There are sometimes problems with hacked versions,though.

: newsgroups, just the local BBS conferences...

Correct, he won't be the 1st. I received another registration for it
this morning (me being the UK support site for Kivi... now at 1.41a)

I have seen many postings on BBSs over the past 2 months from people
using Kivi. They started with Kivi 1.37 (unregisterd) and have moved
on to 1.41a unregistered. IMHO, they should pay up if they are using
it so much! Especially if they go onto newer versions... It doesn't
cost that much, and think about the savings on phone costs.

2664. Superbase Professional 3.2 ... Aaarrrgggh - BUGS??

Newsgroup: comp.sys.atari.st
Date: 1995-08-22 00:00:00 UTC
From: psmith@sydney.DIALix.oz.au
Message-ID: <41a3rm$hp9$1@sydney.DIALix.oz.au>
Source record: 160303

Hi,

My Superbase Professional 3.2 seems to lose contact with the system DOS on saving some records. It is not the dreaded 'problem positioning in data file' error, the error is 'file not found'.

If anybody has any suggestions I would be glad to hear them.

My file structure is:

File Records Indexes Fields

Address 14000 5 11

Contact 20000 3 8

The files are linked on one field , the record number.

Thanks, Peter

2665. Convert samples to .au format?

>Let's not turn this into a My Program/Country is Better Than Your
>Program/Country. The original point of this thread was that according to GEM
>Bench, Warp 9 is faster in ST Medium, and you've said nothing to dispute that.
According to the recent survey, approximately the same number of people in this
newsgroup have Falcons as STs. If you think the Falcon users are using
ST-Medium, you are deluding yourself. The reset are TT users, and I don't think
they use ST-medium either :-)

So I think more people using their Atari's for serious work don't use
ST-Medium - at least not of the people reading this group.

From: mstclair@iac.net
Message-ID: <41cng4$a8@wabash.iac.net>
Source record: 160309

Well, I don't really expect this to work, but I'll give it a shot....

I have a Vectrex video game system that I am preparing to auction off in a week or so, but I would be willing to trade it for a Falcon instead.

It doesn't have to have a hard drive or monitor, but two megs would sure be nice... Of course, If I get multiple offers (yeah, right), the most loaded one wins :)

Seriously, if you want to own a piece of videogame history (vector graphics!), here's your chance. Oh, yeah, it's got about eight games, and almost all of them have the overlay, manual, and box.

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

In DB Master, the ascii delimited output is in the form of a report.
DBMaster breaks the entries with CRLF, but you should be able to find
a program that converts the carriage-return,line-feed to comma if you
need to. Or your PC program might be able to perform that as part of
its import function.

Let us know how this turns out, please

Well, in all honesty, that's not too helpful ;-)

But hey, it's a start. Is there any way to search for a user on GEnie?
I don't have a GEnie account. Thanks for the effort, though :)

2679. Hypertext and ST-Guide

Newsgroup: comp.sys.atari.st
Date: 1995-08-22 00:00:00 UTC
From: Auburn Placer County - Tahoe City <libaubt1@nic.cerf.net>
Message-ID: <Pine.SUN.3.91.950822121116.830C-100000@nic.cerf.net>
Source record: 160318

Hi everyone,

I'm fiddling with hypertext, and I keep having a problem. I'm
trying to load resource files into the text. It works, as long as I
reference the objects by number, and not by any #define statement in a
header file. This is strange to me, because ST-Guide says that you can
@include a header file with define statements for the object. However,
every time I try, the compiler says something about how the define for
FORM1 was not found.. Example:

```
@include test.h

@node test
@tree OBJECT
OK OK_node
CANCEL Cancel_node
@endtree

@{"Click here to see dialog" link test.rsc/OBJECT}
@endnode

@pnode OK_node
This is an OK button
@endnode

@pnode Cancel_node
This is a cancel button
@endnode
```

Now, what is wrong with that? It should work, but it doesn't :(
Any ideas?

2680. Re: q: sm124 adjustments?

Newsgroup: comp.sys.atari.st
Date: 1995-08-22 00:00:00 UTC
From: valega@qns2.qns.com

Source record: 160319

Ben Van Mil (VanMil@mindlink.bc.ca) wrote:
: Re. the adjustments......

: As for it being a older used model I get your point, to adjust it to a
: larger screen size still means that you need to bring up the voltage with
: the result that you will likely fry something,
This is not true. Yes you are increasing the voltage, but the chasis was designed with the ability to handle this increased voltage. Many SM124's that have not been adjusted out fail also, just as soon. This is a myth that expanding the screen by tweaking causes failure.

if you want it to last bring
: it to a shop where they can do this properly.

: To draw a parralel, if you have an old car and wnat to replace the engine
: for a better stronger one but do not change the transmission the next thing
: you are likely to have problems with is the transmission or the rear-end,
: the same holds true for Monitors.

: By the way, the screen size on a Hi-res monitor is positioned more in from
: the side then that of a Mid-res monitor.
This >is< true, most of us know this. some SM124's came from the factory with slightly more border area than others. They can all be adjusted.
: BVM.
As someone else pointed out though, you can't have razor sharp focus in the middle of the screen, and at the corners at the same time. You can have one, or the other, or a compromise between the two, which is what you want, slightly favoring the center of the screen. Enlarging SM124's by adjustment also sometimes leaves the corners looking less "square", than before adjustment. If your really brave, there are 4 small magnets in metal clips, that are attached to the backside of the yoke (coil on neck of tube) with 1 philips screw each. These are for correcting the "squareness" of the corners. However, they are glued to the metal clips, and sometimes need to be "unglued" and rotated within the clip slightly, besides moving the position via the clip. These magnets have a small square hole in the middle. You can get square tools also.... This is only if your really anal retentive about your corners though. I agree with the person who set his back close to normal. You get better overall focus when SM124's are settup in normal size, and a little enlargement looks good, without getting blurry near the corners.
Just my 2 cents.... Dan Valega (valega@qns.com)

There are ready-to-install MiNT and MiNT-Net distributions, for example
the TAF-packet, KGMD.

It was none other than Theodore L Hopman who did write on 19 Aug 95 that ....
TLH> No, you're doing everything right. IIRC, the distribution _is_
TLH> mostly source, but the binaries are in there somewhere. Look for
TLH> socket.xdd and slip.xif files. It's been a while since I've set up my
TLH> system, so I'm not sure if there's more to just tossing the *.xdd and
TLH> *.xif files in you c:\mint folder, but try it, and it should work.

Yes from Mintnet archive that is all that is required ... the easy bit .
However there are 2 slip drivers and Only 1 should be added asnd unless you
need it there is also another one not neccesary (The driver for the parallel
port ethernet adaptors (De600)).
TLH> Whether you'll actually be able to do anything is another story,
TLH> since MintNet doesn't actually supply the software you need to dial
TLH> in to your provider. Get the MintNet FAQ, uploaded fairly recently to
TLH> a.a.u.e, according to a posting here, and you should be doing a lot
TLH> better...

This is not true , Thre are Mint software to do whatever you want on the net
including all Client and server applications . to dial into provider all he needs is either
DIP (SLIP) or PPPD (PPP) and a few mintes to edit the
script files.

You have probably got the best available, then! Lucky guy.

AC> It looks like I should be able to just run a ribbon cable from the
AC> SCSI connector on the board to a hard drive--is it that easy? Can
AC> I daisy-chain SCSI devices with this board, or can it only control
AC> one?

Yup. You need 5v and ground to the P4 pins. DMA to DMA IN (did you get a cable?) then a ribbon cable (less than 3 metres total) with enough connectors on it to plug into all (!) your SCSI devices. You can have 7 devices on this bus - SCSI ID 6 is reserved for the on-board battery backed clock.

You should remove termination from all devices other than that furthest away from the controller board. The AdSCSI+ will handle devices which need parity so there are no worries here.

If this is your first SCSI experience you may well need to get a PSU to power the board and devices. Think seriously about seeking out a second-hand PC cabinet. This will have a PSU of around 200w with a bundle of connectors PLUS the right shaped bays to mount your devices! They can be had for peanuts.

AC> Do I need any kind of driver software or anything? (This is my first
AC> ST hard drive experience, so forgive the dumb questions. 8-)

Of course! You would probably be best starting off with the ICD stuff. You should be able to get most of this (except for the commercial CLEANUP.PRG and SCSI.PRG) from bulletin boards. After a while you may decide to use another driver for reasons of speed - HDDriver is supposed to be good and the one I use, from Supra, is very nippy and reliable.

You are in for an exciting experience, m8e, let me know if I can be of further help.

Source record: 160325

Hi,
I just resurrected my 1040ST and treated it with a bubble jet printer
(Canon bj 200e). Most of the stuff which is on my disk is 7+ years old,
and it seems like I could use up to date printer drivers.

The software I am currently using is 1st word+, Singnum2 and STAD.

Does anyone have the appropriate printer drivers for those programs, or can
tell me what to change in the printer settings in the case of STAD?

Thanks a lot
Christian

IMG files can't be scaled without blockiness. GEM files are vector graphics, and they're what you see on the screen in Works.

I just got an e-mail from Wolfgang Wander, and he said that CoNnect doesn't need HSmodem, so if you don't understand it, don't use it. So, I ended up taking out SCC and DRVIN, and now I can set my port rate for 115200, which I couldn't do before.

As for the U:\DEV\MODEM1, that's for use under MultiTOS. Modify your MiNT.CNF file so that it mentions something about (falcon.doc):

Running MultiTOS on the Falcon, CoNnect sometimes did not
find the right serial device to work on. Use one of the
following lines in MINT.CNF to get rid of the problem.

either
setenv MODEMDEV U:\DEV\AUX
or
setenv MODEMDEV U:\DEV\MODEM1
or
setenv MODEMDEV U:\DEV\MODEM2

Without MiNT, this stuff does not need to be done, though. So, remove HSmodem and see if it works. I couldn't get mine to work either :)

I run Bmapfix and Fpatch2 in my auto folder.

There is a very good Atari ST emulator for the PC. It is sold under the name Gemulator. The product is a combination of a 8-bit PC card on which you can place more than one version of TOS and software for the emulation. The current version of the software is 4.0. This version supports windows 95. You ST can run very smoth under Windows 95. Gemulator is supplied bij Branch Always Software. Gemulator is developed by Darek Mihocka (a former microsoft employee).

Gemulator is a very good product and gives you a very good oppertunity tu run your terrific Atari software in combination with Windows and DOS software.

Gemulator is ditributed in Europe by ACN/ Atari ST nieuws, P.O. Box.5011, NL 2000 CA Haarlem, The Netherlands.

Hoping to have served you with this information

Phone Rombo ?

>> with indoor or poorly light video source but the colour and
>> definition was pretty acceptable.
RG> Yes this is a bit tricky. Good lighting seems very important for
RG> any kind of video work.

yep normal house lights give too much RED balance and trying to kill that
washs away a lot of colour. I found thought that VIDI would grab everything
very dark indoors though .. could be my VC I suppose ?
Expose doesn't seem nearly as sensitive in this area and seems to behave
quite well in ordinary lit indoor situations.
>> Yep if you want to do real time Video grabbing then you need the
>> Expose Board which is excellent at this sort of thing .
RG> Basically I'll buy something for my PC if I need anything more
RG> flashy. The VIDIST-12 will do for the moment though.
RG> :-)

Seen some nice desktop TV things for the PC and FalcAM (Bundled with Expose)
the Falcon equiv is not as good as it could have been I think... the Window whilst giving a
very good frame rate is not resizable so you
are stuck with a very small window on a hi res screen .. I would have liked
to have been able to sacrifice a bit of frame rate to get slightly bigger
displays.

> make the software that I seek?

STadel works fine in 512k, but STadel is old, the source has passed through many hands and Fnordadel is the latest encarnation of STadel. Haveing never fooled with Fnordadel I don't know if it still works in 512k. You can find STadel and Fnordadel on a.a.u.e in the Telecomm directory, but it is not the latest. (last actually) If you need help with connecting with CitaNet, just ask.

Actually, I succesfully got a PC to read a 82 track 11 sector disk.
But I no longer have the PC and I've forgotten how exactly to do it, but I can
easily look it up if anyone is interested. You have to add a "driveparam" line
of somesort to your CONFIG.SYS...

I recently downloaded this. It's c00l! Can't wait till the color support and
network stuff comes... (It could also use a better name...)

Hmmm, some can and some can't, I guess. On the PC I no longer have I had to
fool
with CONFIG.SYS to make it read an extended format disks...

Hehe, I've heard Macro$haft is now putting their software on exteded format
disks of some sort, yet another example of MS stealing from the rich and
giveing to the poor...

Maybe yours can, but not all can. Of the many PC's I've tried it with, only one

could directly read an 800k disk...

I need space for new hardware! And $$$'s to upgrade exhisting
hardware! So the unneeded equipment has to go! Not to mention,
I could use the room.... It's getting crowded in here!

F O R S A L E

* 1040STF *

720K Internal Drive
TOS 1.4 ("Rainbow TOS")
2.5mb RAM (Upgradable to 4mb <?>)
Z-Keys (?)
Tweety Board!!
IBM (Internal) keyboard hardware
IBM (External) Keyboard included!
Original Box
Power cable
Great Condition!!
NOTE: This computer has the nicest, CLEANEST upgrades to it that I
have ever seen. And I've seen a many!
Asking $250 + shipping

* 520 ST *

Power Supply
Original Box
Z-Keys
512K RAM
Asking $50 + shipping

* Futures Systems 3.5" floppy drive model GTS-100 *

External double sided drive
Power Supply
Full black case
Good Condition
LED display
These types of drives work exellently!!
Asking $75 + shipping

* 2400 baud modem *

Made by Cardinal
New Condition
Original Box
Manual
Power Supply

Asking $30 + shipping

* Computer Table *

From what I've actually seen of this computer table,
it's in good condition. Partital 'hutch'.
Asking $75 + Shipping

* Joysticks *

Some misc joysticks. May throw these in with the 1040STf,
if they have not been boughten by the time the 1040 sells.
Otherwise, make me an offer!!

* Hard Drive Case *

Will hold up to 4 drives. Comes with the power cable, power supply,
and fan. It's not great to look at, but it deffinaly does the job!
it's grey with a creamy-white face plate. Asking $30 + shipping

* Hard drive Case *

Desktop style case that will hold 2 drives with LOTS of room left over.
It's off-white in color. It looks fairly nice! Comes with power supply,
power cable and fan. Asking $25 + Shipping

MG> don't think they use ST-medium either :-)

And if you think this group accurately represents the Atari userbase as a whole, then it's you who is deluding yourself. Surely, you don't think there are more Falcon and TT users than ST/e users.

MG> So I think more people using their Atari's for serious work don't use
MG> ST-Medium - at least not of the people reading this group.

I'm not disputing that, but I never was talking about this group specifically. I was talking about Atari users in general.

Most software has original boxes and documentation.
All software are original disks, not back-ups or copies.
Some of the hardware also has the boxes that they came in,
but some do not, such as the hard drives, disk drives for parts,
1040 case and RF shield, etc.

All prices are in US Dollars and do not include Shipping costs.
All prices are negotiable and open to reasonable offers.
Payment by personal check will be shipped after the check clears
my bank, aprox. 5 working days. Payments by money orders will be
shipped the day after payment is received.
Priority will be given to orders of 5 or more items.
This list current as of: 8/20/95

Item Name starting with (P) is possibly sold, in negotiations,
or awaiting payment.

Thank you for that information. I have tried several fixes, with none working. Is bootstra.ttp a TT program? It is not with the Mighty Sonic package. I also have problems with the DSP at 32mhz. Is this also related to the TT ram? I was told to add a buffer at the 32mhz clock on the Falcon U8. Do you know about this? I know other users that do not have this problem and some that do.

Thanks,

Mike

Folks,
Im looking for a copy of a program called Xmon for the Atari.
It is a screen driver for a Moniterm 19" monitor (SM194). Apparently
it was written by Doug Wheeler (Ex "Code Head" programmer). Any one
know where I may be able to get a copy of this program?
Alternatively any one know what/where drivers are available for the
19" mono monitors. My friend (whom I'm requesting this for) is currently
running bigmon. He's had a few problems with this and was advised to get
xmon. Any differances??? Comments??

Thanks,

David

Of course the Falcons are competitive to a PowerCrap. E.g. compare Cubase Audio 16 with the Macintrash version. You save thousands of bucks if you decide to buy the Falcon w/ CA16 instead of the Mac plus CA _plus_ expensive additional Audio hardware.

This money can then be invested in a nice Triton board PCI Pentium running Linux.

An sc1435 color monitor
a sh204 Shoebox Hard-drive with a 50 Mb drive installed
also externally hooked up original st225 20Mb drive. Both have no bad sectors &
the computer works excellent.
also I have an external sf354 external floppy & a mouse, mousepad & a joystick.

The drive has some programs on it, Neodesk 4 & some other useful utils, I'll
leave it on if you want, if you don't you can delete it... I bought the drive
loaded so I don't have all the manuals...

Also I have a GVC 14.4 External Modem (6 months Old) with the original boxes &
stuff...

The Ste & the Monitor have the origibnal boxes, but the Hard-drive doesn't have
the box, but I do have the manual...

Also I have a Citizen 120D 9pin dot matrix printer to go with it too..

I am asking for everything... 650.00

Which I think is a steal considering the STe is only 2 years old...

The 1435 monitor has an add on low rad filter on it...

I think this price is more than fair...

Don't you

My phone number is (416)-253-9509 & ask for Mike, that's me & we can discuss it
further...

Thankyou for your time

Michael Farrell

My ST used to work OK until you streamed to or from the disk which caused
it to fall over. The problem was the ASCI cable - I think the driver was
a bit flaky and the capacitance of the cable screwed up the data.

I'd suggest trying a new cable (System Solutions and I went through about
4 before we found one that worked)

>

The mouse on my ST used to do this - when I got my Falcon I moved the mouse
and the problem (slowly sliding upto the top of the screen) followed it.
So I junked the mouse!

Some of the reformatting programs reach 400K side. I think the Format
was Twister, which offered higher capacity and at least faster reads.

: I agree, the software does exist, and it works well, but AFAIK, much of it
: requires MintOS to work because many of the packages are ports from UNIX.
: MintOS is _not_ part of MintNet, although the first does require the
: second. Also, unless you get a compilation, the various
: client/servers/etc. need to be gotten separately again from MintOS.

I have to beg to differ. The only thing you need to run dip is an
/etc/passwd file, which you can fake out by adding one line:

root::1:1::/

Or something similar. MintOS is nice, but is not required for any of
the net software.

What client/servers are you talking about? there is httpd which is a
seperate archive, and inetd as another seperate file. In MintOS is the
finger client, but that's not terribly important that you can't live
without it.

> and a Stereo 16 Replay cartridge. This configuration works fine for me,

Hi Theron,
If I've understood you right, you need some kind of hard disk recording system.
Most things I know of are commercial products, but there may be some good
shareware programs as well - maybe someone else knows...

There is Clarity Falcon - successive to your Replay 16 - which only handles 2
tracks, so if you want 4 tracks, that's not of any use.

SoundPool has made 'Audio Tracker', an 8 track digital "taperecorder" that
records to a SCSI hard disk on the Falcon. This has no midi sequencer built in,
but can be synced to MTC as master or slave. It has a lot of functions, f ex
reverb, 10 band equalizer, punch in/out and many other.

SoundPool also has a Mastering system called 'Audio Master', but this only uses
2 tracks. However, it seems to be a very professional program, which is module
built, with the additional modules: 'Midi sync', 'Analyser', 'Equalizer' and
'Dynamic compressor'. The program's main goal is to make mastering, with level
optimizing, cutting, rearrangement, crossfades and a lot more...

If you plan on getting into serious hard disk recording and eventually also
midi sequencing, there is only one thing to do: Get Cubase Audio.
Cubase Audio is by far the best hard disk recording system and if run on a
Falcon instead of a PC or Mac, you can still buy much more stuff to the studio
when a PC/Mac owner still tries to save money for buying the essential stuff
for the hard disk recording - the price for a comparable system is at least the
double if run on other platforms than the Falcon.

I hope I've helped you out a little with my comments.

Best regards,

Claes

Maybe... That was the case in Sweden many years ago but today anyone still
using the ST for anything but games is most likely using high-resolution.

> PS> And if you don't use your ST for serious work, you have no need for
> PS> neither Warp 9 or NVDI so why bother comparing?

"Serious work" - anything other than playing games and watching demos.

Anyone using an ST for anything other than games would be even better served by
first buying a high-res monitor, then we can start discussing software. :-)

> PS> I own both and Warp 9 aren't that bad but it's had its day. It's like

>Bench, Warp 9 is faster in ST Medium, and you've said nothing to dispute that.

I'm not turning this into anything, it was a "my program is better than your
program" to begin with. I'm not disputing your statement, only saying that
NVDI is overall a much better product than Warp 9. That's my opinion based on
first-hand perspective, having used *both* products on the ST, STE and Falcon.

If you don't agree, fine with me. You're entitled to an opinion, just as I am.

From: 917254@edna.swin.edu.au
Message-ID: <41f79l$kl4@lucy.swin.edu.au>
Source record: 160278

Could anyone please e-mail me any information about the atari 520 ST, my girlfriends family has just been given one with very few working games, and other programmes. It has a single 3.5" floppy drive. It plugs into the TV and works fine with what it has got, mouse included.
When was it created, it seems newish in some aspects and old in others, eg the about says that the desktop display is copywrite 1984 or something. looks like a mac on 320X200 res.

I have found an ftp site that has a few games for an atari and I was wondering if there would be any possibility of putting these programmes on a disk with an IBM based computer. Do you have anything which will allow me to copy programmes in atari format on my computer. Also are these games likely to work on such an old machine. if it is as old as it seems.

Any information would be extreemly welcome.
by e-mail to:
u3917254@scrooge.ee.swin.oz.au

Thanx in advance,
Ron.

STOP STOP STOP

NEVER adjust the powersupplyvoltage of a (any) monitor !
If you want a bigger screen there are other ways to do that; adjusting the
VSIZE, HSIZE controls is the way to go.
If you increase the powersupplyvoltage you thereby increase the cathode-ray
tube high-tension voltage too.
That may have very dramatic results; amongst them are
-_much_ faster burn-in of the tube
-much higher strain on the flyback
-shortened life of the monitor and tube
-exponential increase of radiation from tube.
Especially the harmful radiation is something to realize, this monitor
does not comply to any (SCO'92, MPRII) minimum radiation standards as it is,
but why make it possibly 10 times worse ?
Tube manufacturers always define a strict maximum voltage for their tubes.
This is done with good reason.
I'd _like_ to get a nice tan looking at my monitor, but there must be
better ways...:-)

2744. Newbie Q: Which TOS for 1040STf?

Newsgroup: comp.sys.atari.st
Date: 1995-08-23 00:00:00 UTC
From: psu01223@odin.cc.pdx.edu
Message-ID: <41eomq$cag@odin.cc.pdx.edu>
Source record: 160281

Subject says it all. I'd like to upgrade my old 1040STf to a newer version of TOS... but which one is best? Mark Baines' Atari A to Z says TOS 1.4 is the last version that will work on a 1040ST... but other people have posted that version 2.06 will also work and is preferable. I want to upgrade mainly because I'm getting a hard drive for my ST, and it looks like TOS 1.4 is less susceptible to the "40 folder bug".

If I upgrade TOS, will I have compatibility problems with my old software? I'm especially concerned about Word Writer ST, Easy Draw, and Lattice C--not sure of the version numbers, but they are all about the same age as the ST.

If I buy MagiC, will that relieve me of the need to upgrade to a newer TOS? If you're using MagiC, does it matter what version of TOS is on the computer's ROMS?

Thanks,

Alex

2745. Text, not Editor!

Newsgroup: comp.sys.atari.st
Date: 1995-08-23 00:00:00 UTC
From: ami0209@rrz.Uni-Koeln.DE
Message-ID: <41fcag$cpt@news.rrz.uni-koeln.de>
Source record: 160282

Hi all,

maybe you can help me and point out any FTP-archive for the ST, where I can download some decent little word-processing programme? I am looking for something where I can create block-texts, have simple search/replace options; you know, something a little more comfortable than Editors (I tried some, they're fast, but rather rough to use if you want to just create some ASCII-Text, letters, etc.

Any help is greatly appreciated. Mail to: <ami0209@rrz.uni-koeln.de>

Cheers,

Johannes

Wizztronics hasn't abandoned the Barracuda, just delayed it. They
have another board called the Hawk that they are focusing on right
now (I don't have the spec list handy) that should be available
within the next few months.

2747. Mint - Where Can I Get It

Good grief, who gives a rat's behind about which is fastest anyway???

NVDI is faster in some respects while Warp9 is faster in others. Both
are excellent products with marginal speed differences between the two.

Either one will do a fine job of acceleration. Pick one and be happy.

Source record: 160286

I purchased Warp 9 and tried to run it on my TT under MiNT. It crashed horribly. I contacted Codehead and their response was "We think you will like our screen accellerator better than multitasking" . NOT! I've heard of several apps that are not compatible with Warp 9. IMHO, this is because Warp 9 tries to be all things to all people: a Pinhead routine, a mouse accelerator, a screen saver, and an graphics accelerator. Result: it hooks into about everything in the system. NVDI seems to "mind it's knitting" and just be a faster VDI. I run NVDI exclusively now.

PH> Can anyone give me some advice about scsi interfaces for my atari ste
PH> 1040? I
PH> have an old 100 meg hd and i want to connect it.

If it's not a SCSI then forget it - it won't be worth the effort. If it IS a SCSI (2 rows of 25 pins for bus input) then investigate whether it will work with parity disabled (some drives insist on parity).

You will need a host adapter to connect ST DMA port to SCSI. If your drive can run with parity disabled you can go for any h/a - otherwise you will have to get the ICD AdSCSI+ (there are one or two others but I couldn't swear to their identities).

You wil need a power supply giving 5v and 12v. For an old drive go for around 30 watt. The easiest way to get something like this is to buy an old PC case which will have a PSU, cabling and bays to mount your drive(s).

You should be able to find HD driver and utilities on BBSs if you don't get it with your h/a.

Ask again if any probs.

Paul Linton (pgl@draco.bison.mb.ca) wrote:
: G'day all. I've been running Cubase 3.11 on an ol' 1040 ST with TOS 1.0.
: I've been happy with the combo, but I really could use more memory and
: maybe a faster machine. There is a used 1040 STE and a Mega ST4 for sale
: in town, and I'm just wondering what would be a better choice? I'd be
: using it for MIDI work only. The STE has only 1 meg, but I could add a 4
: meg SIMM, right? Any insight would be appreciated. Thanks!

Depends !

The Mega has an expansion bus for graphics cards and the separate keyboard
is nice. On the other hand, the STE has a more modern version of the
operating system (1.62 vs 1.02) and you can just plug in SIMMs as you say.
The 1Mb version has 4x256kb SIMMs so you need 4x1Mb SIMMs to go to 4Mb.
The STE also has better sound than the original (or Mega ST) and `extended'
controller ports. The best recently-released games work only on the STE
and Falcon (Stardust, Substation) so that's another reason to go for it.
Neither of these is any faster than the original ST, though (apart from
having blitters which makes some difference to graphics).
Unless, of course, the Mega ST is a Mega STe, in which case it has a
16MHz processor with cache RAM so it is considerably faster than the
earlier machines and worth getting (also VME bus like the TT).

Overall, if it's a choice between an STE and a regular Mega. I'd go for the
STE but it's not a big improvement over what you've got. It might be
cheaper to get a RAM upgrade for your old machine and maybe a TOS
upgrade - 1.04 is a plug-in option and is similar to 1.62 in functionality.

Aidan.

] anybody help?

You'll never find one for the macintosh, heck, it's hard enough finding
depackers for LZH, ZIP etc. on the mac' :)

The program you want is "New Depack". If the machine doesn't have the
memory to handle the combined size of the packed & unpacked file, then
it can't unpack it. New Depack is in an archive called something
like ndepak11.lzh, anyway, hook up to micros.hensa.ac.uk and have a look
in the Atari directory on there, (pub/micros/atari/ IIRC)
It's easierr via Gopher or WWW.

You have to keep your demographics in mind, Patrik. In Europe, the monochrome monitor is by -far the most popular unit, with an installed base of some 80%, IIRC from the last survery. In the US, on the other hand, it's almost the reverse. The vast majority of users use color.

There is no doubt that word processing, dtp, and a slew of other tasks are much easier to perform (if not outright mandatory) in high res mono. But... if one is programming software for a given market, you need to use a monitor that is compatible with the majority of your customer base, and in the US, that's color. The best monitor of choice depends on the application so the term "serious work" is highly subjective.

Papyrus won't do this. I think Calamus SL might have a module for
postscript output, but someone who uses it would know for sure. 1.09
certainly doesn't do it. Calligrapher has postcript output, and should
run OK on a Falcon AFAIK.

2763. For sale - ATARI ST softare and Manuals CHEAP

Newsgroup: comp.sys.atari.st
Date: 1995-08-23 00:00:00 UTC
From: samhuin@wam.umd.edu
Message-ID: <41g2n9$7u6@cville-srv.wam.umd.edu>
Source record: 160300

I have a bunch of Atari programming utilities, languages, manuals,
books etc... I am willing to sell either individually or the
whole thing inexpensively, but am looking to sell ONLY to someone
in the Washington D.C. Metropolitan area or possibly Baltimore.
I don't want to sell by mail unless I can't find any local buyers.

Some of the stuff I have is:

HSOFT FORTH language disk and manual
A few C compilers and manuals
Personal PASCAL
HSOFT Assembler language disks and manuals.
Minix for Atari ST - disks and thin manual that comes with it (I don't
have the thick Tannenbaum text book on operating systems)
Books on Atari Internals, Graphics programming etc...
Full set of manuals and compilers, utilities etc... for Atari Development
Kit.

I just don't have time for ST hacking anymore. So, all this stuff is
for sale, plus lots I didn't list. Just name a price for it all and
if you pick up in D.C. area, it is all yours. New, it cost me
a bit - some I got used, but I will give it to you WAY cheaper than
I paid.

Finally, I got a Supra 20MB hard drive that a friend already has
reserved for buying, but if that falls through, please give me
your best offer. It is a fairly new disk in it, but MIGHT have a slight
controller/disk problem, since I can only use 80% or so of the disk.
It includes case and power supply. Just turn it on and start up.
It is being sold for $50.

------- Mike

The 'White Balance' on my camcorder (Panasonic NVR-33) copes very well with
this, unless I started mixing different types of light sources. Getting
the overal light levels high enough is the main problem. The 'backlight'
feature on the camcorder increases the grain too much.

> everything very dark indoors though .. could be my VC I suppose ?

Adjusting the sliders in the VIDIST12 software does help a great deal.

> Seen some nice desktop TV things for the PC and FalcAM (Bundled with

> think... the Window whilst giving a very go od frame rate is not

The bottom line with me is that I don't own a Falcon and am unlikely to
buy one at this late stage. Therefore AFAIK Exposes is a non starter for
me. The PC is pretty unsuitable for this type of work - but at least it
is fast, has loads of disk/RAM and a decent video card.

> are stuck with a very small window on a hi res screen .. I would have

My TT, at least, does *not* supply termination power (TERMPWR) so the ZIP
is unlikely to work directly from it. However it is fairly easy to get many
other SCSI devices to supply TERMPWR - so as long as you have something
else on the SCSI BUS which does supply it - it should still work.

As IMHO and AFAIK

:-)

If you are using a Falcon030, try SuperSam. It will save files in .au format quite happily, although note that they are still saved as PCM rather than mu-law or a-law which are more usual in .au files.

Look for SSAM108B.ZIP - should be on almost all Atari ftp sites by now.

I hope to release a new version by the end of October which will handle conversions to and from a-law/mu-law formats.

From: bjr@EbiCom.net
Message-ID: <41i7va$gd6@Einstein.EbiCom.net>
Source record: 160221

Aloha,
What do I need to do? I've used ftp under mint to download stuff
for my atari. It is all currently sitting on a minix partition and I'd like
to move it over to a GEM partition so I can use it under normal TOS. Can
I just mv the files from drive e to drive c? Thought it would be a good
Idea to ask around...don't want to risk wiping out my whole GEM partition.

Oh, by the way...why is there a shadow of the minix partition when I boot
mint? My minix partition is physicaly set to drive letter E, but there
is a shadow of it under U.

I've looked all over for a FAQ on mint...and have very little documentation
on the stuff...know of anywhere I could find such animals?

Thanks much,
Brian

Hello,
I've got an olf TOS 1.0 FM Marpet-Boarded up to 4 Meg. I use the old MasterSound sampler catridge that uses the cartidge port. Trouble is I've usually only got access to my old SM124. The software only works in low res, but none of the color emulators I have seem to work after I installed the RAM upgrade. Are there any emulators that can do this or is there some P.D. around that can use the cartridge ?
Thanks,
Giles.

I have an STe with TOS 1.06. Someone gave me TOS 1.06.2 chips, but I haven't gotten around to installing them yet. I'm not very comfortable with hardware hacking, esp. removing the very brain of my best computer! What are the advantages of TOS 1.06.2 over 1.06? When and if I do the swap, would I be able to install the 1.06 in one of my other machines STf or STfm? Would there be any advantage to this?
Thanks, Atarians!

Current situation in the UK is that Hisoft are advertising the Zip drive
(their ads say end of August, but were composed a while ago, so it is
likely to be later) with specially written software, but no comments about
TERMPWR.

System Solutions aren't advertising it yet, but said some time ago that
they would modify the drive so that TERMPWR is supplied, but they said
nothing about software.

From: Ari Feldman <ari2550@delphi.com>
Message-ID: <Z1HDLLr.ari2550@delphi.com>
Source record: 160233

Actually, the for the first couple of years in the Atari ST's production run, they used EPSON drives. These drives are distinguished by the small ejector buttons. Later, Atari switched to Panasonic (I think) drives which had the large ejector button. Still, these drives were all capable of accessing 82 tracks w/no problem ever. In fact, I remember creating a disk with 86 tracks at one time...

PC's on the otherhand, use no-name brand or cheap brands like Chinon or Qume. I've heard various bad things about such mechanisms although I don't have any bad experiences myself. A PC can afford a cheap floppy since they're so cheap and easy to replace as well as only seldom used. Meanwhile, on the average ST, they are the only way to read/write data if you don't have a HD.

BTW, if you have problems reading ST disks on your PC, you can try the program FD-Format. It contains a TSR that allows PCs to read extended disk formats. There's another program (the name escapes me) that also allows you to write PC compatible boot sectors to your ST disks on the PC.

The Yolo Atari Club Web page has enjoyed another update. Check it out and make sure we have your favorite US dealer listed in the list of dealers, make sure we have your favorite software publishers listed with links to their e-mail or web pages, make sure we have your favorite user-groups listed, favorite Atari-related magazines, favorite software products, etc... We will try to update these pages frequently. Hopefully they will make it easier for people to find the software they want, find dealers to get stuff from, and find out how to get in touch with the people creating software and hardware.

I don't believe there is a shareware version of MiNT available.

However, there are to freeware versions: One directly from Atari
Corp. at atari.archive.umich.edu:/atari/Mint/mint112[bds].zoo and one
hacked-up version called FreeMiNT from the MiNT mailing list at
ftp.inf.tu-dresden.de:/pub/atari/Mint/Kernel/freemint-1.12.4-{bin,src}.tar.gz.

: > make the software that I seek?

: There is some VERY good BBS software for the ST, the best being RatSoft (IMO).
: But if you want a free (well, shareware) package then check out QBBS (Quick
: BBS), it should be on Umich.

However for a 512K system, I would recommend the STadel software which should still be at umich. It DEFINITELY runs on the 512K machine, and isn't that bad on a floppy only system. I ran one for 4 years with NO problems which weren't of my own silly tampering with the system.

It's TOTALLY different than most bbs's you see, but is VERY simple and low in sysop maintenance. The last version was 3.1g as I recall, but there was a Fnordadel variant of this software, but I don't recall if it ran in a 512K machine. I don't expect RatSoft would be very useful in less than a 1Meg and Hard Drive system.

I've just gotten a used Falcon myself, and was having a similar problem with STalker. All you have to do is get ahold of the program FPATCH2 and stick it in your AUTO folder, and it'll re-map your operating system so that programs can find the modem port - the problem was that Atari changed the addresses in the system so the program is looking for it in the place it would normally find it on an ST or a TT......

(The Falcon's GREAT, BTW - now all I need is a VGA/SVGA monitor)

DV> have switching supply's in SM124's.

Well, the UK model does. I had quite a struggle getting one working a year or so ago and tracked the fault to a faulty RF inductance in the switcher's base circuit. I was puzzled to find this component there and, at the time, put it down to a requirement of the strict US RF emissions standards.

DV> Any other monitors should never have
DV> the power supply's B+, or output voltage adjusted, unless you know
DV> what to set it to. i.e. you have the serv. manual, and have repaired
DV> the power supply and need to confirm it's output.

It also had a B+ ADJ pot.

I'm using a bog standard PC SVGA ATM all I needed was a connector for the
monitor because the one it had was too wide for the Falcons video port. I think
it was about 10ukp from Gasteiner. Is this what you're after?
BTW the display is excelent. I could be looking at a PC ;)

Hello android Fasoldt! The 16.08.95 you talked about "NVDI vs Warp9",and my reply is:
> Rubish. I own and use both Warp 9 and NVDI in their current versions.
> Something must have been munged in your NVDI setup.
>

Sorry about the delayed answer,the gate to my internetlink was gone for a while.

Nothing was wrong with my NVDI setup. But i clearly stated that the tests was done with Gembench (v 4.03). And with Gembench, Warp is faster.

>

Sorry about the delayed answer,the gate to my internetlink was gone for a while!

Yes, i know. And i clearly stated that i used Gembench (v4.03) and with Gembench, Warp is faster.

And i am more interessted about faster text than graphics. I dont play games. I use my computers to work with.

Sorry about the delayed answer,the gate to my internetlink was gone for a while!

>> 1. Use the LATEST versions when testing.
>>
>> 2. Test ALL not only display.
>>
>> With the newest versions, Warp is faster.
>
> In hi-res also?
>
> What is the newest version of Warp 9 anyway? Is it still supported?

I think the newest full release is v3.80 . But i dont think its supported anymore. Correct me if im wrong in any of the above points.

> I usually prefer NVDI since it has built-in GDOS.
>

I use Speedo-Gdos instead when ever i need other Fonts. But the fonts to Warp is not that bad either.. But they are not GDOS compatible.

And Warp together with Speedo-Gdos is still faster than NVDI :-)

That depends on the BIOS.

Some BIOSes actually look at the disk and read the number of tracks/
sectors, but most are more comaptible and say ``Oh, it's a DD-disk,
let's use T80/S9''.

BTW the disk-format has been specified by Microsoft :-)

IBM introduce a new format to store more information on a disk
for OS/2.

They are using larger sectors and have reduced the ``overhead'' between
sectors. I've seen it somewhere before, in the late 80s :-)

Its looking for your non-existant tape drive, its is after all short for "Tape
ARchive". Type "tar xvf foo.tar" to make it use the hard drive.

>my best computer! What are the advantages of TOS 1.06.2 over 1.06?

Maybe the TOS 1.62 (not 1.06.2 - btw) comes in other ROMs. There
are three 'jumpers' (0-ohms-resistors) the mainboard to specify,
which kind of ROMs/EPROMs you are using.

The jumpers are labeled 'W102', 'W103' and 'W104' and have to be
connected in the following way:

Eprom-Type W102 W103 W104

27256 open 1 and 3 open
27512 2 and 3 2 and 3 open
571001/27C1000/531000 2 and 3 2 and 3 2 and 3
27010/571000/27C1001 1 and 2 2 and 3 1 and 2

You should try settings for 27010 first, when your TOS 1.62 comes
in chips with 28 pins.

What are the advantages in TOS 1.62?

IIRC TOS 1.62 contains a better GEMDOS (version 0.21 - TOS 1.6 is only a
version of TOS 1.4 with STE-specific code and GEMDOS 0.19) and the
'DESKTOP.INF'-bug was fixed (you will not need STE_FIX.PRG any longer).

>When and if I do the swap, would I be able to install the 1.06
>in one of my other machines STf or STfm? Would there be any

No! TOS 1.6, 1.62, 2.5 and 2.6 are 256kB (TOS 1.4, 1.2 is only 192kB)
and start at address $E00000 (TOS 1.4, 1.2 starts at $FC0000). So you
can not just swap chips!!

The second problem: TOS 1.6, 1.62 and 2.5 contains STE-specific code which
will cause TOS to crash on old machines! - even if you have additional
hardware (like the TEC-board) to use the chips in an ST, STfm etc..!! Only
TOS 2.6 can be used in 'non-STE'-machines too.

Ciao... Arno

2815. Re: 1040 STE or Mega ST4?

Newsgroup: comp.sys.atari.st
Date: 1995-08-25 00:00:00 UTC
From: m152244@proffa.cc.tut.fi
Message-ID: <41k3ef$rsr@cc.tut.fi>
Source record: 160154

Paul Linton (pgl@draco.bison.mb.ca) wrote:
: G'day all. I've been running Cubase 3.11 on an ol' 1040 ST with TOS 1.0.
: using it for MIDI work only. The STE has only 1 meg, but I could add a 4
: meg SIMM, right? Any insight would be appreciated. Thanks!

Well, the MegaST4 with TOS 1.2 and with blitter chip is quite the same as
the STE considering the speed but STEs have a little bit better(?) TOS
version, at least 1.6. This version has some shortcuts etc and a better
fileselector but when the only purpose is MIDI, it is not so important.

What I really want to say is that 1040 STEs which are originally
equipped with such a memory has four 256 SIMMs and if you want more RAM
you must take those old SIMMs away and puchase 1MEG SIMMs.

The other subject is that the oldest STEs had some problems with HD so
if you are going to get an HD it is better to test it with your machine.
But if the STE is not 89-90 -model, it should have no problems.

2818. x/ymodem problem with uniterm

Newsgroup: comp.sys.atari.st
Date: 1995-08-25 00:00:00 UTC
From: shrabar@zea.cc.fer.hr
Message-ID: <41kbmk$hdd@nippur.irb.hr>
Source record: 160157

Some times ago (about month) i found some articles on this group which
claimed that UNITERM is one of the best VT100 emulators available. I
got it and I am generaly satisfied. But I have problem with file transfer:
xmodem and ymodem work correct for download (UNIX host to ST) but sending files
in oposite direction does not work. After several errors and retries UNITERM
reports :No acknowl. of sector. At UNIX side situation is very strange:
the host received file (but with several escape characters at the beginig
and the end of each line), but it is received as COMMAND instead as file.
I will be very grateful if someone can help me!

>Idea to ask around...don't want to risk wiping out my whole GEM partition.

Yes, just move the file from your Minix partition to your TOS
partition using your favourite method (desktop, mv, whatever - not
Kobold though)

>Oh, by the way...why is there a shadow of the minix partition when I boot
>mint? My minix partition is physicaly set to drive letter E, but there
>is a shadow of it under U.

The U: drive ("Unified") contains links to all drives, A: B: and so
on. It also contains some special directories like dev (for devices),
shm (for sharing memory between programs), and pipe (for inter-process
communication).

Well, The Falcon is a 32-bit computer. Atari dosen't make any computers anymore, but there are several new Atari clones out. I know of two Falcon clones: Mk.1 and Mk.2, both made by C-lab(a german music company). They are aimed at the MIDI and Music market, but they will run all Falcon programs, including video ones. I am not aware of price, but you can get one from Toad Computers.

It was none other than Gary Wagner who did write on 24 Aug 95 that ....
GW> I spent a few hours last night attempting to backup my minix
GW> partitions, mainly because I have 4 of them and I want to
GW> compress that a little (I keep adding more as I get rid of my TOS
GW> partitions, and it's getting silly with 4!)
GW> I used TAR, and all went well until about the 30th disk when the
GW> damn thing BUS errored on me :-(I was using the MiNT friendly
GW> version in the Tools directory at a.a with the options -c -b 2 -L
GW> 780 -v -z -M Which if I understand correctly is for -c (create) -b
GW> 2 (block size 2x512=1024) -L 780 (Disk size 780 blocks) -v
GW> (verbose) -z (compressed) and -M (Multi-volume) . Oh, I forgot '-f
GW> /a/backup.tgz'
GW> Anybody had any luck doing this themselves? I'm running MiNT 1.12
GW> and MinixFS 0.6pl9 (I think)

Nope I use GEMAR and stick everything onto TAPE<G> ...

However I think you're problem might be down to the stack size allocated to
TAR ... sounds similar to a problem that I have come across copying large
files between minix and TOS files systems.
Try running fixstk <size>K on Tar and try again .

<Size> try 20 and see if that helps , when you first run it it will report
the current size which is possible 0 in which case I think this is def. you
problem. Are the disks minix BTW ? Sorry if that is a silly question as I
never tried tar onto Floppy..

You need more physical RAM. That means you'd require a TT or a Falcon.

There are, as yet, no RAM doublers for the Ataris, but that dfoes not mean it can't be done. I know of one talented developer who says he could do it (he'd done it on another platform), but the payback would be small for all the work involved. It may also require 030 machines -- which, when you think of it, negates part of the value of a RAM doubler, since 030 Ataris can handle a lot of physical RAM already.

Provided that other device is supplying TERMPWR. If its not then you are no better off than with just the ZIP on its own.

The other device should be supplying TERMPWR but I have seen working SCSI systems with no termination or TERMPWR. They only go wrong when you start adding more devices.

All AFAIK and IMHO of course ;-)

:-)

Roland.

All these tricks require a real MMU (not the MMU chip in the standard ST),
which limits it down to the TT, Falcon or other 68030 based Atari/clone.

It is possible to go past 4Mb on a normal ST. There is aparrently some
German(?) hack involving a second (Atari ST type) MMU chip. However the
best bet would be a Marpet XTRA+8 RAM board. This will take a 4Mb TOS 2.06
ST up to 12Mb. Not cheap - and I don't know if it is MiNT compatible.

> with most ST software, or only a few select programs designed
> specificly for it? I seem to recall Lexicor offering some sort of

These are generally compatible - though MiNT-X (as used in the TAF package)
was never very happy with them AFAIK. Same need for a 68030 CPU as well.

> keep running out of memory really quickly. Speed isn't all that
> important for me at this point...so I don't mind waiting a bit for
> a hard drive to grind...I'd just like to be able to run some of the
> larger Unix type X-windows software, and 4 meg just wont cut it.

I've tried X on my PC Linux box in 4Mb. Constant swapping - and almost
totally unusable. Virtual Memory is a neat hack - but is best used as a
top up to a reasonble amount of main memory - not as a solution for not
enough memory. I run X under Linux on my TT in 8MB RAM and its great. It
does delve into the virtual memory from time to time - but this doesn't
cause the machine to thrash.

> be greatly appreciated. I'd like to tinker with Mint, Linux,
> Xwindows, and some big gem based graphics applications (Big pics

In order to tinker with Linux you will need that 68030 again - and a FPU
chip. ;-(Linux does however come with Virtual Memory built in - so at
least you don't have to buy any more software. Much better than any MiNT
lash up IMHO.

All AFAIK and IMHO of course,

:-)

> I boot mint? My minix partition is physicaly set to drive letter
> E, but there is a shadow of it under U.

U: is the universal drive. All the disk drive letters in the system appear
under it as directories.

The advantage of this is that UNIX shell commands (like 'ls') don't
know about drive letters so as long as you work drom drive U: you never
need to specify a drive letter to get at any file on any of your disk
drives.

There are other uses for it as well, mainly to do with 'virtually'
reorganising your disk structure to be more UNIX like.

:-)

I cannot help you if you don't specify the brand of the card...
And even then it's not too easy, I don't have all docs.

>BUt upon booting up, it passes the memory test, loads the Auto STUFF, but
>soon after getting on the desktop or running memory intensive apps, it
>will crash on me.

Very likely due to a defective SIMM or different type (all four *must*
be of the same brand & speed) or SIMM's that just will not work.
The TT Ram cards, alas, are very picky when it comes to SIMM's.
You can sometimes fix that by setting the waitstates (jumpers) properly,
but again, you must know the brand of the card.

>Can anyone help me?

Well, I tried didn't I ? Email or Post of you got additional info.
While you're at it tell me the brand and speed of the SIMM's too.
The brand sometimes is only a logo. If so, describe it.
If you don't know the speed, describe all the characters of one of the
chips.

Yes, it is a problem with some mice. IIRC for instance Genius suffers
from this. I know there is a hardware solution (inside the mouse) because I
read about it some years ago. As it is impossible to track down where I
read it, I guess junking is about the only solution :-(
It had something to do with timing or bad design of electronic circuits.
For the brave-hearted: try copying the atari- or logitech electronic circuit
and put something similar in the bad mouse, that should fix it.
...NOT easy, that one...
ACN in the netherlands have logitech mice for sale. So have I but I don't
deliver abroad, sorry... Very nice mice indeed.
Prices anywhere in the $25 - $50 range.(I'm really not sure...)
Reach them, if you're lucky, at +31 23 351100.

2849. Re: NEW Atari Announced

Newsgroup: comp.sys.atari.st
Date: 1995-08-25 00:00:00 UTC
From: maberg@xs4all.nl
Message-ID: <303e4852280d4f2@xs4all.nl>
Source record: 160188

Hi you all !

Yet another message from the original poster who started this thread.

I recently had a conversation with one of the top men at ACN,
who published the article about the MicroBox.
He said that his source was *very* reliable but he declined all my
questions otherwise, out of fear the source could get in deep trouble.
Though he did not say so much as that, I believe someone at Atari
spilled his guts. The fact that ACN, of all people, got the right to
buy the entire stock of Atari europe at vianen (about a year ago)
leads me to believe they have connections quite high up.
Anyway _I_ got the strong feeling he meant what he said...

On another note, I read in a dutch newsgroup that the former technical
staff boss at Atari netherlands, W. Kilwinger, said he heard about the
MicroBox development but claims it was a 68030 based system that was
abandoned in 1993.
He left Atari 'round that time to join Vobis, so I reckon he might not
be aware of later developments though.
But he tried hard to convince everyone there was no hope left for Atari.
As I know him, that is not surprising... I think he (although he is a
very good engineer) never really felt at home at Atari...
Kinda reminds me (a very little) of one certain R. S. we all know.

Food for thought ?
You all draw your own conclusions, I do have high hopes.

L8R,

Well, that proves again that versions differ from country to country.
Over here we basically have two models, the ones with fixed powercords and
the ones with a normal mains socket on the unit. The ones with the fixed
cables have SMPS and are somewhat in the majority. They are the 'newer' ones.

>: If you want a bigger screen there are other ways to do that; adjusting the

No, you're wrong about that, but an understandable mistake :-)
The ZIPdrive does not need termpwr, but the Link does.
But you don't need a Link on a TT or Falcon so no problem.

No advantages at all, read on...
Check your info again. TOS 1.06.2 never existed. If you mean TOS 2.06
you need to change two soldered 'jumpers' on the motherboard, IIRC
W1 and W3.
I don't think 1.06 will work in a STf(m). TOS 1.06 was a TOS 1.04 with
the necessary changes for the STe.

Theoretically I have one for sale, in _perfect_ condition (*).
One megabyte RAM only as you will probably know. 40 MB harddisk. Monochrome.
6 Months old, used 3 months. I am first owner, it was imported from the US.
BUT there IS a big problem: I really cannot ship abroad, too risky and I
dont want to get hassled with exportlaws, -regulations etc.
But if you're _really_ interested you can try and convince me otherwise...
Or pick it up when you're on holiday :-)
I'm afraid I will not part from it for anything under 2000 dutch guilders.

(*) Apart from my engraved name and adress inside it (not normally visible)

Agreed, the B+ to the flyback is directly related to the radiation, and even
making the vert & horiz. adjustments does increase the VLF magnetic field,
but very marginally. If you put two monitors side by side, within 8" or less,
you can see the effect of each monitors vert. field emitted from the yoke,
it will interfere with both monitors, causing a funny looking effect. I >think<
that is part of the spec for clean emissions, that is the Very Low Frequency
emissions, IOW, the vertical field put out by the yoke (coil around the tube)

Hey you do have to admire old Wild Bill Gates. He has suckered all them Messy
DOS users into doing what all the Atari, Amy, and Mac users have been doing fo
r 10+ years and charging them 100+ clams to do it. On top of that he has convi
nced then that what he is peddleing is the latest technology.

Isn't it interesting that Microsoft is taking 50megs of disk space and 16meg o
f ram to do what Atari and Amy and Mac accomplish in 200-500k and 1 meg of ram.
They flout that as major progress and people are buying it.

Like PT Barnam is quoted,"There is a sucker born every minute."

Hopefully a fellow Falconeer can guide me in the right direction!

I'm trying to get a USRobotics 28.8 Sportster modem working with my Falcon. Using STalker with the modem on the TT/MSTe Modem 2 Port, I can only manage connection to remote modems at 9600 baud or less. I have tried with and without hardware handshaking. I've also tried different combinations of serial fixes (HSMODEM, FASTXSER, DRVIN & SCC.) Not sure what could be wrong... have also tried many different software settings (hell, I used to run a BBS, I thought I knew how to setup a modem!) :)

Perhaps, I need to modify one of the Falcon's ports to gain higher data rates than 19200 (previously used a 14.4 Sportster for 19.2 access with the greatest of ease.) If anyone is using the new 28.8, I'd love to see your configs!

Thanks,
Kula

2866. **** Ch.A.O.S. ****

Newsgroup: comp.sys.atari.st
Date: 1995-08-26 00:00:00 UTC
From: Jeffrey Wood <woodzy@delphi.com>
Message-ID: <RpOArv5.woodzy@delphi.com>
Source record: 160113

Hi, and welcome to Ch.A.O.S. Country. Welcome to the revolution. The Cheyenne Area Orphaned Systems, or Ch.A.O.S., is a club devoted solely for the preservation of classic non-IBM systems, such as ours, and for the defeat of Microsoft. If we wanted IB
M compatability, we would have abandoned our systems long ago. Those of us who do have IBMs, but still use our classics, only bought them out of necessity, such as for work or school.��This is not a political organization. We do not hold any specific r
ight wing or left wing political views. We do believe in fair competition and Microsoft is NOT fair. We spent all that time and money on our respective systems because the performed the task or tasks we bought them for. Wether it be for gaming, educat
ion, office, or whatever, our classic systems performed upto our expectations, and in some cases, beyond the original design. Why should we abandoned everything we put into our systems?��I have been working on the designs of two programs that I feel wou
ld unite all of our systems, yet retain the sovereignty or flavor of each individual system:��1. A terminal shell with game maker to allow two or more non-compatable systems to play games over the modem or in a mini-network. Of course, standard protoco
ls will have to be set between computers to ensure game play. But, graphics between two different systems wont have to be the same because screen data wont be sent, just tiny info packets. The games would take full advantage of the graphics and sound c
apabilities of each individual system. The games would be played as close to real time as possible.��2. A DEVICE OPERATING SYSTEM (DOS) desgined on a bi-level format: The primary level is a whole new computer that provides cross-platform compatability
between our classic systems. The computer will be based on the PowerPC. This will allow each classic system to be enhanced to that of at least a 486. Without losing much compatability with the existing sytems. Full compatability is not guaranteed be
cause of the new enhancements to each individual operating system. But, at least you wont have to abandon your whole classic system! The secondary level is a whole new disk operating system for the original classic. This will allow direct disk access
communication between ALL systems. Yes, even IBM. Just imagine, a C64 computer operating system with 38k free RAM, can now have as much as 3.75 Meg free RAM on a 4 Meg System! This is directly accessable without bankswitching or even use as a RAMDISK!
Just imagine the fresh, new applications that can be developed that retained the original C64s flavor. No, this is not limited to the C64, but to all classic systems, such as the Atari, Tandy CoCo, VIC20 (YES!), Apple, etc.��All of our classic systems
have their own uniqueness, their own distinctiveness. That is why we refused to follow the industry or marketing trends. This would allow us to preserve our systems and at the same time develop a cross-platform industry standard. Who says we have to
follow the Microsoft standard? Lets follow a standard, sure, but we should also be allowed to keep our systems we have devoted so much time and energy into!���Cheyenne Area Orphaned Systems�c/o Jeffrey Wood�813 Covered Wagon Drive�Cheyenne, Wyoming 820

In article <Z1HDLLr.ari2550@delphi.com> Ari Feldman <ari2550@delphi.com> writes:
|
|Actually, the for the first couple of years in the Atari ST's production run,
|they used EPSON drives. These drives are distinguished by the small
|ejector buttons. Later, Atari switched to Panasonic (I think) drives which
|had the large ejector button. Still, these drives were all capable of
|accessing 82 tracks w/no problem ever. In fact, I remember creating a
|disk with 86 tracks at one time...
|
|PC's on the otherhand, use no-name brand or cheap brands like Chinon or
|Qume. I've heard various bad things about such mechanisms although I don't
|have any bad experiences myself. A PC can afford a cheap floppy since
|they're so cheap and easy to replace as well as only seldom used. Meanwhile,
|on the average ST, they are the only way to read/write data if you don't
|have a HD.
|
|BTW, if you have problems reading ST disks on your PC, you can try
|the program FD-Format. It contains a TSR that allows PCs to read extended
|disk formats. There's another program (the name escapes me) that also
|allows you to write PC compatible boot sectors to your ST disks on the PC.
I tried this second program and all it did was make my disk totally
unreadable. There is also a program STTOPC.com that will copy from
even extended formated disks. After using ST2DOS on a previously
readable disk (with STTOPC), that disk was no longer readable
(with anything). This was with a 9/80 too... ???

I'm not sure what else you will need but you should upgrade STalker to
version 3.04 (the latest) This upgrade was available a while back on
GEnie and actually went through two levels before arriving at 3.04. I
believe you could contact Gribnif Software at (413) 247-5620 and get the
upgrade. It will give you the port speeds you need ie.: 38.4k, 76.8k,
153.6k. You may also need to have the HSmodem or whatever activated but
STalker 3.04 has the port speeds you need to get started.

2874. Geneva 004 and Neodesk 4.04 Updates?

Newsgroup: comp.sys.atari.st
Date: 1995-08-26 00:00:00 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <DDxJ7B.DB8@novice.uwaterloo.ca>
Source record: 160121

Hey all,

I just got a newsletter from Gribnif stating that Geneva 004
is ready and patch disks are available. It can now run over
MiNT - I can't wait to see that since I have rarely used Geneva
since MintX came out and now I tend to use MultiTOS so that
I can still connect via PPP and run telnet and ftp and lynx and
tin, etc. Neodesk 4.04 is also available as a patch disk.

Are these on any ftp sites yet? I would rather download them
then wait the 4-6 weeks for a patch disk if I order them. I am
also moving next week so I'll be in a state of flux for a while.
I assume they are posted to GENIE (to which I do not subscribe),
do the Gribnif guys have any objections to putting the patch disks
on the 'standard' internet archives of atari stuff. I know they've
been pretty good about it in the past.

BTW, after I move I will try and get some updates to the TAF
MintX/Chimera distribution out the door and I will be working
hard on a GEM WEB browser now that I'm done with school. FOr
those of you who e-mailed me with questions, I will try my
best to find a day to reply to everyone. I will also be
finding a new internet service provider and will have a new
address soon.

Thanks,
Samy Mesbah

2877. Super Sequencer Package FS!

Newsgroup: comp.sys.atari.st
Date: 1995-08-26 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <h3Mh7I+.johnhechtman@delphi.com>
Source record: 160124

****** SUPER MIDI SEQUENCING PACKAGE FOR SALE! ******

1-1040STE with 4 megs of ram/TOS 2.06/Atari mouse. Unit is very clean and well maintained. Would be "like new" except for small cigarette burn on case that I polished out so you can barely see it.

1-C-Lab Notator/Creator SL package. This is actually _2_ sets of disks for both Notator _and_ Creator, along with _2_ dongle cartridges - one for Notator, one for Creator. You could set up _2_ systems with this software - one w/Notator, one w/Creator (of course you'd need a second ST as well). The Notator disks have the latest updates to version 3.21 or maybe 3.22 (I'd have to look). Full manual, disks, all in perfect condition.

1-SM124 Hi-rez mono monitor. No burn-in and the "100% failure rated" 2.2uf bipolar capacitor has been replaced. Case is clean, but has a bit of the mounting pad for a mouse holder that was stuck to it on one side of the case. Unit has been tweeked to expand the image (it's BIG). This is the monitor that C-Lab recommended for use with Notator SL.

1-ICD Link 1 with software, manual and ACSI-to-SCSI cable. We used this to hook up our floptical drive (21 meg removable) but you can use it to hook any SCSI drive to the 1040STE. I use an identical unit to access my cd-rom drive, SCSI HD and floptical - works great! The Link, cable, disks and manual are all like new.

I want $500 USD for this system and I want to sell it _as a system_! I'll think about selling individually only if no one picks it up as a unit. So you're welcome to bid on individual items, but your bids will be considered _after_ those of package buyers. Please, no silly low-ballers - don't waste your/my time.

If this system is so great, why am I selling it? We got a Falcon and Notator Logic! Works like a charm, but now I have to make back _some_ of the upgrade cost (grin). Please send replies to my Internet address at Delphi - it's "johnhechtman@delphi.com".

Source record: 160126

```
================================================================
JUNIOR OFFICE FAX SOFTWARE (by TKR) - English Translation (by me)
----------------------------------------------------------------

Denesh has kept me up to date with the demand for this piece of
software, and I can only make the most profuse apologies for not
having publicly released it as of yet.

The fact is that I have been simply too busy since Easter setting up
my own small business (BPFD), and have neglected most of my life,
including anything computer-wise.

Actually, the Fax software works quite well, and is practically all in
good English. Unfortunately there are numerous bugs within it, which
were probably introduced by my translation...

However, if you are prepared to live with certain limitations it is
most definitely usable - It has handled the incoming and outgoing Fax
needs of my business acceptably (NOT faultlessly!)

I do not intend to rectify these faults - in fact I doubt whether I
could without starting the translation from scratch.

What I intend to do instead is get old of Junior Office version 3 from
the authors, and translate this from scratch, avoiding errors. This
will subsequently be available as an incentive for those users who
register version 2.

Registrations will be available through:
CyberSTrider, 203 Parr Lane, Unsworth, Bury, Lancashire. UK.
by Denesh Bhabuta (danny@micros.hensa.ac.uk or dbhabuta@cix.compulink.co.uk)
```

and will _probably_ cost in the region of £10-£15.

```

>your configs!
You do not need to do any hardware modifications. Here are a few tips:
1) Try different software. I suggest you download Connect and try with that.
Perhaps the terminal emulator you are using was simply not written with
Falcon in mind.

2) Re-install HSMOD. Read the documentation carefuly. Both SCC and DRVIN have
to be installed and in the correct order. If only one of them is active, you
will get crashes.

While I use a 14400 modem (ZyXEL 1496E), the link between my modem and my
Falcon is permanently set to 76Kb/s, so you should not have trouble with
your 28K8 modem.

> have TOS 1.0. Whats the deal?

The deal is, that you have a pirated copy of the software; it is a
commercial program that, to the best of my knowledge, hasn't been
supported in several years. I did a review of it once, and the problem
you're having is due to the fact that the copy protection scheme requires
the original disks in order to set up the program. The warning you
received seems to be a generic warning that has little to do with the
actual problem.

So, simply put, it ain't gonna work. And aside from the fact that your
copy is illegal, it really isn't worth the effort; MultiGEM rather stinks
compared to any of the other multitasking utilities available today.

there is no Linux68k target in the original gcc sources yet, you'll have
to add the Linux68k diffs too. With that, it should be possible to make
the obove mentioned crosscompiler.

I sometimes had problems, when I copied or moved *.tar.gz-files from
Minix-FS partitions to TOS partitions. (I did get corupted archives).
The most save way for me was with dd (disk-dump).

I was using a TOS floppy, I couldn't see the point in minit'ing a load of
floppy just to put one tar file on each. (I think I might invest in a
second hand tape drive anyway, when I can afford it!)

Thanks for the hint though - I'll try changing the stacksize when I've got
some time to sit down with that pile of disks again :-)

Cheers, Gary

The precense of a ".forsale" group would also likely result in more people making use of it, than the current setup where posts are intermixed with general ST conversation. When the CFV comes up, you can count on a "YES" vote from me.

From: Ari Feldman <ari2550@delphi.com>
Message-ID: <xnMjzz7.ari2550@delphi.com>
Source record: 160133

Actually, ST2DOS just writes an IBM compatible boot sector to your ST disks just like the MSDOS boot sector option of DC-Format...

There are other differences between the early ST disk format and the 720kb PC format as well - this being a different distribution and location of FAT sectors. This is why your PC can't read the disk.

You *might* try using Norton Disk Doctor on a backup copy of the disk to make a correction to your disk. I've done this before and have had occassional success.

BTW, there is also a program on the Atari side called something like IBMCVT that will convert your ST disk to a fully IBM FAT compatible disk structure...worth a try!

Ari

2887. Can you tell me about MacMint?

Newsgroup: comp.sys.atari.st

Re: _Falcon and 28.8 Modems_, Kula Bocca wrote to All on 25 Aug 95:

KB> Perhaps, I need to modify one of the Falcon's ports to gain higher data
KB> rates than 19200 (previously used a 14.4 Sportster for 19.2 access with

No, the Falcon does speeds up to 115200 right out of the box.

KB> the greatest of ease.) If anyone is using the new 28.8, I'd love to
KB> see your configs!

Set STalker to 38400 (the highest rate in common with USR modems that it currently supports). Set up STalker for hardware (RTS/CTS) flow control, and make sure your modem is also set up that way.

Put DRIVIN.PRG and SCC.PRG, in that order, last in your AUTO folder, and configure SCC to the following settings:

Drivin: ON SCC: 0
OFF 0
OFF
OFF
0
ON
OFF
OFF
65534
2048
u
u

Now, many of those will work with other settings, and your mileage may vary and all that, but this is what I use on my BBS and with STalker, and I have no problems getting CONNECT speeds up to 33600 (my USR Courier goes that high).

* LED v1.31 * Get off that Atari diet - Freq ATARINET @ 1:209/745 and pig out!

Hi there,

In a message of <25 Aug 95 10:59:58>, Monkala Kari (2:200/427.1) writes in
area 'COMP.SYS.ATARI.ST':
> The other subject is that the oldest STEs had some problems with HD
> so if you are going to get an HD it is better to test it with your
> machine. But if the STE is not 89-90 -model, it should have no
> problems.

The problem with the faulty DMA chip is solved quite easily - just by
exchanging the DMA chip to the one that was actually made for the STe.
Atari managed to place the wrong DMA chip in a whole series of motherboards
(the chip was made for the old ST/f/m machines) and this makes the hard disk go
nuts. The sad part is that for a period of time all these machines were known -
because of the serial number - but in the end of the STe era there could be
faulty motherboards in any of the new machines as well, so it's not safe to
assume that it's only a limited series any more. If you intend to buy an STe
and want to use a hard disk, just open the computer and check which DMA chip is
present (U300) - it should never be C025913 in an STe, but rather 398739-001A.
Another chip that has caused problems in some cases is C100110-001 - this one
was made for the STe, but it doesn't work as it should in all machines and in
case of any harddisk problems, it should be exchanged to 398739-001A (this one
should work perfectly in all STe's).

Have a nice day,

Claes

I thought about that, it needs at least 8mb RAM, 14 is better, it also does
proccessor emulation, so it would be pretty slow on a non-accelerated Falcon.
Get the source, compile it, and tell us what happens...

It might be worth checking with USR that you've got a good Sportster;
there was a batch which went out a few months ago with dodgy ROMs (IIRC).
USR are replacing them gratis; try getting in touch with them (sorry, don't
know their US phone no. or email address.)

If you're only interested in running Cubase and assorted ancilliary programs, then my advice would be to go for the Mega4 - the advantages of the e and TOS 1.62 are worth far less in the music game than the 4MB of memory. If you want to speed Cubase up, lash out on a copy of NVDI 2.5 - System Solutions in the UK are knocking it out at UKP30. The merits and otherwise of NVDI and Warp9 have been debated at length recently; personally I've found Cubase runs *very* happily with NVDI, and in a timing-critical system such as a MIDI sequencer, I'd trust a VDI accelerator far more than a speeded-up processor. All IM(NS)HO, of course.

It may also be worth pointing out that second hand Sound Tools systems keep turning up; if you're interested in digital audio, a preloved Sound Tools is probably going to be the cheapest way into it - and you *must* have a Mega for it to run.

If you buy the Mega and can't get on with it, drop me a line and I'll swap it for my 4MB STe, and pay postage!

> your configs!
>
>
>>>>

Yes, with STalker you will have to select the 'Other' port to
be able to set the speed up to 38.4 or 57.6. I don't use any serial fixes
in the AUTO folder and I connect at 28.8 most of the time. Once in a
while, it will only get to 26.4 or 24 on Long distance calls. Oops,
FPATCH2.PRG, does that have a serial fix in it? I think so.

To run Cubase (non-audio) really well you are going to need 2mb of Ram or
more, 1mb is a little cramped. To run Cubase Audio well you will need a
Falcon, with its DSP chip, and 14mb of ram to have a decent audio buffer
size. To get good information and ongoing discussion about Cubase and
access to some of the programmers who regularly contribute, send an e-mail
to majordomo@.mcc.ac.uk leave the subject line blank and write this
as your first line of the letter:

subscribe cubase-users <your e-mail address>

: In case they used different types, how can I tell the difference
: in one type and another?

The Megafile-30 uses a RLL mechanism, and most are Seagates (which suck). Any RLL drive should work, but keep in mind RLL drives are no longer manufactured and any you buy will be refurbished or used.

Some extra info... The Megafile-30's are based on the Adaptec ACB-4070 architechture.

I recommend selling your M30 and buying a ACSI-to-SCSI host adapter (ICD preferrably) and a SCSI drive. They are far faster than RLL's and come in outlandish sizes for little money (compared to a RLL). You'll be glad you did.

2911. Cursor keys in CoNnect 2.46

Newsgroup: comp.sys.atari.st
Date: 1995-08-27 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <41pv0r$iri@gti.gti.net>
Source record: 160062

I am using the english version of ConNect 2.46, and lately have noticed
a very annoying habit that changes my cursor keys from VT220 numeric
to VT220 application.

What happens is I save my setup for 8 bit VT220 and numeric cursor keys,
but at some point in time, it switches into application mode. This is
mildly annoying, especially when running Lynx, as I have to keep going
back to the setup menu and changing it around.

The same thing also happens for character set. I often access a VAX running
VMS, so have the character set at VTxxx, but each of the banks
is set for ASCII. Again, at some point, bank G1 changes into graphic
character set.

Does this happen to anyone else? How can I stop it from happening?

Thanx

SORRY folks - the Disconnect menu option never did work - I meant
to fix that before I put the disks together but we were in a bit
of a rush!. The hangup alias in a tcsh window does work and wat
is a substitute for 'Connect' from the menu. The reason it is
wat is because I was using it to connect to the University of Waterloo.

All this stuff will be fixed in the next update (which should be soon)

There are no hardware modifications of the port, but you'll need HSmodem (the Falcon version consists of two programs in the AUTO folder: DRVIN and SCC).
Also make sure that you don't run the serial CPX that came on your language disk - it should be placed where it belongs - in the trash!
I run a Sportster 28800 with no problems at all on my Falcon, so it should work on yours too.

Hi Robert,

The drive they used was RLL. If I remember correctly, you can also use MFM - I
seem to remember that the interfaces should be compatible, but one of them is
faster (I don't remember which one).
However, RLL and MFM drives are no longer manufactured, so your only chance to
get hold of them is buying used stuff or at some surplus sale.
I would get a Link II SCSI interface and a SCSI harddisk instead, since these
are available without any problems.

I've just switched to an STE running TOS 1.6 and am curious what the bugs
in it are so that if they occur I will know its them and not my machine
dying! The only hint I've had so far is the Poolfix program whose notes
say the bug is rare. On the other hand others have told me 1.62 fixed
some bugs but they don't really know what they were.
I look forward to some poetic waxing from a die hard Atarian let loose
with an opportunity to both praise and complain at the same time!

>only manage connection to remote modems at 9600 baud or less.

I use CoNnect, Upoint and CoMa on Falcon's Modem2. No Problems.
(RTS/CTS-Handshake working at any Programm)
HSModem is installed. (First you must copy DRIVIN.PRG, second SCC.PRG
into your Autofolder!) SCC's setting is korrect?
Serial speed ZyXEL <-> Falcon/Modem2 is locked by 76800 Bd
16K8, 19K2 conections all time ready.
I think it's only a problem by your hsmodem/modemsetup.

STalker ? I dont now..

regards
Robert

Aloha,
Anyone know if there is a TOS patch out there that allows the GEM
desk top to dump to HP Laser printers (HPL 5 Printer Language)? This option
doesn't work with either of my printers (the other is an LQ-500) and I
think I read somewhere this could be changed to suit your printer.

Thanks,
Brian

2921. Windows on Supercharger

Newsgroup: comp.sys.atari.st
Date: 1995-08-27 00:00:00 UTC
From: bjr@EbiCom.net
Message-ID: <41qfu8$cel@Einstein.EbiCom.net>
Source record: 160072

Aloha,
I've an old supercharger (1.05 Software)that I rarely ever use...
but it does still work. Just for kicks I booted it up the other day, and
found myself questioning its usefulness this day in age. So, here's a few
questions...

1. Can a 1meg supercharger run Windows 3.1? I have used 3.0 in protected
mode before, but didn't keep it in the setup because it wasn't my own
registered copy of Windows (I hate pirates). It didn't want to multi task,
but it would run most of the Windows stuff I borrowed to experiment with.

2. Has anyone found a way to get the Supercharger to look at a CD Rom?
I have a Chinon 525 and Extendos. DOS looks at all my partitions except
the CD. Yes...the CD drive letter is after the DOS partition...so might
it read it if I could find a program that swaps drive letters around? I
had an ICD accessary that would do this...but when I switched to an STe
it refused to run on TOS 1.62.

3. Anyone succeded in getting a SuperCharger to run WinSok? If not...
anyone know of a PPP package for DOS? A DOS netscape or Mosaic perhaps?
With only 1 meg of ram...I'd really rather stay away from Windows.

4. What is the latest DOS you've managed to get installed on your
SuperCharger? I'm still using DOS 4, and wondering if it is possible
to upgrade to the latest DOS.

Thanks,
Brian

STalker directly supports the Modem2 port.

> Oops, FPATCH2.PRG, does that have a serial fix in it? I think so.

Yes, you definitely need FPATCH2, but you still need a serial fix, such as

MG> with Falcon in mind.

STalker works fine at high speeds on the Falcon.

MG> 2) Re-install HSMOD. Read the documentation carefuly. Both SCC and DRVIN
MG> have to be installed and in the correct order. If only one of them is
MG> active, you will get crashes.

I don't know about crashes, but yes, DRVIN has to be first.

MG> While I use a 14400 modem (ZyXEL 1496E), the link between my modem and
MG> my Falcon is permanently set to 76Kb/s, so you should not have trouble
MG> with your 28K8 modem.

That won't work on his Sportster, because USR modems don't do 76k. They do
38.4k, 57.6k and 115.2k, but since the highest of those that STalker also
supports is 38.4k, that's what he needs to use.

Hi Carl,

> Could you give me the _latest_ prices for an Atari World
> subscription?
> Thanks for spreading this magazine in the Scandinavia!

My pleasure! Read on:

ATTENTION ALL SCANDINAVIAN ATARI USERS!

Subscribe to English monthly Atari magazine

A T A R I W O R L D

Sven Bornemark Musik handles Nordic subscriptions
for this superb mag, written by former ST Review
staff.

One neat trick is that you can subscribe WITHOUT
or WITH Readers Disk, and also on a quarterly or
annual (yearly) basis.

==========
Here are the *Swedish* prices:
==========
3 issues without Readers Disk : SEK 140:-
3 issues with Readers Disk : SEK 190:-
13 issues without Readers Disk : SEK 560:-
13 issues with Readers Disk : SEK 760:-

Back issue (magazine only) : SEK 60:-
Readers Disk (each) : SEK 30:-
==========
Pay to postgiro account *23 59 59-4*

==========
Here are the *Norwegian* prices:
==========
3 issues without Readers Disk : NOK 120:-
3 issues with Readers Disk : NOK 160:-
13 issues without Readers Disk : NOK 480:-
13 issues with Readers Disk : NOK 640:-

Back issue (magazine only) : NOK 50:-
Readers Disk (each) : NOK 25:-
==========
Pay to postgiro account *0806 1903977*

==========
Here are the *Danish* prices:
==========
3 issues without Readers Disk : DKK 110:-
3 issues with Readers Disk : DKK 140:-
13 issues without Readers Disk : DKK 440:-
13 issues with Readers Disk : DKK 560:-

Back issue (magazine only) : DKK 50:-
Readers Disk (each) : DKK 25:-
==========
Pay to postgiro account *015-3087*

==========
Here are the *Finnish* prices:
==========
3 issues without Readers Disk : FIM 85,-
3 issues with Readers Disk : FIM 110,-
13 issues without Readers Disk : FIM 340,-
13 issues with Readers Disk : FIM 440,-

Back issue (magazine only) : FIM 40,-
Readers Disk (each) : FIM 20,-
==========
Pay to postgiro account *800053-1092211*

Please state clearly:

1. What issue your subscription should begin with,
ie "issue 5/September".

2. Your name and address (makes life so much easier
for me!).

A letter or email confirming your order won't hurt
either.

As a bonus you'll also receive a Scandinavian
Supplement (with Swedish text and ads).

Stay in touch with the REAL world - ATARI WORLD!

Best regards

-Sven-

Hello android Bocca! The 26.08.95 you talked about "Falcon and 28.8 Modems",and
my reply is:

> I'm trying to get a USRobotics 28.8 Sportster modem working with my
> Falcon. Using STalker with the modem on the TT/MSTe Modem 2 Port, I can
> only manage connection to remote modems at 9600 baud or less. I have

Have you changed the portspeed in STalker to 38400!!!??
You cant run a 28.8 with 19200 setting.

> Perhaps, I need to modify one of the Falcon's ports to gain higher data

No. That is not needed on a Falcon.

Grtz from Sweden:

] What's this? TOS 1.62 never existed? Bah! My STe had TOS 1.62...
]
] The differences between TOS 1.62 and TOS 1.6 were very minor - mainly
] bug fixes like fixing the AES/VDI window handles, the memory pool bug,
] etc.
]
] It might of only been available on US machines but it did indeed exist!

Nup, my UK STe has TOS 1.62 as well, AFAIK, there were also all the
other versions, (German, French....) of 1.62.

There were only 2 changes. They got rid of that stupid bug that
caused the desktop to be unable to boot up in Medium resolution without
hacking DESKTOP.INF or using a patch, and fixing the problem requiring
POOLFIX. My nice new STe, (although it had a stuffed audio pin
on the RF out which Roger fixed, as well as a dodgy SIMM port, which
he also replaced all of, which now contain a nice 4meg :) came with
UK-TOS v1.92 back in, oh, I'd say late 1990/early 1991.

I've found that one way to disconnect is to open the tcsh window
and issue the command "hangup". The module on the X-windows menu
doesn't work on my STe either...but the alias command in tcsh seems
to work fine. If hangup doesn't work...type alias and you'll see
a list of commands...I remember it being hang-something. You can
also use the wat command to establish a connection from the shell.

Message-ID: <41p1mp$6ah@golem.wcc.govt.nz>
Source record: 160083

] Are these on any ftp sites yet? I would rather download them
] then wait the 4-6 weeks for a patch disk if I order them. I am

I ordered my update the other day, Dan was surprised how quickly I'd ordered as they'd only posted the letter about 5 days previous, (unusually fast for air-mail), and he reckoned that being so flat-out at the moment, it's far quicker to get them via mail than email at the moment. Everything I've ordered from Gribnif has turned up very quickly, (with the exception of my pre-ordering Neodesk 4 by about 4 months, my problem, not theirs :) They're certainly one of the many quick & helpful Atari companies still going & via the internet....

] BTW, after I move I will try and get some updates to the TAF
] MintX/Chimera distribution out the door and I will be working
] hard on a GEM WEB browser now that I'm done with school. FOr

How about a GEM-Lynx for us poor sods with ST's for Medium resolution? (Basically your WWW without the graphics, which seems to be most of the call for higher res', so, should be possible!?)

```
] |Actually, the for the first couple of years in the Atari ST's producti
] |they used EPSON drives. These drives are distinguished by the small
] |ejector buttons. Later, Atari switched to Panasonic (I think) drives
] |had the large ejector button. Still, these drives were all capable of
] |accessing 82 tracks w/no problem ever. In fact, I remember creating a
] |disk with 86 tracks at one time...

I've owned 3 ST's, my original, an old 520STFM, had a crappy Chinon
disk drive which packed up. My second, a slightly faulty 1040STe had
a Sony drive. I forget what this machine has, but I've also seen some
with Epson and Teac drives. AFAIK, the brands they have used have been:

Chinon
Sony
Teac
Epson
and as you say, probably panasonic, although, you may be thinking of Sony
there, similar sort of companies.

I've had them being able to format 81 tracks (the Chinon), to 84 tracks
(whatever this one is, Epson I _think_)

2934. Oasis 1.30/NOS: H E L P ! !

Newsgroup: comp.sys.atari.st
Date: 1995-08-27 00:00:00 UTC
From: floating pile of pestilence <chrishinds@delphi.com>
Message-ID: <RPADc4P.chrishinds@delphi.com>
Source record: 160085

So far, I've gotten finger,ftp, and ping to work OK

The problem with news is an inability to post...I can get news articles fine, but I keep getting "480 Transfer permission denied" from the news server. Has anyone else had this problem, or could it be the service providers problem???

On the mail side, I can send mail usually with no problem, but I cannot receive anything. I know other people had this problem, but I thought with them it was because of POP3, but my provider has SMTP, so I don't know what's going on.

Don't I have to specify my username somewhere in order to get my mail? But looking through the startup.nos file, my username is nowhere to be found

I'm at my wit's end...I want OASIS to work so badly, but I seem to have nothing but trouble. I'm especially concerned about the mail problem. Has anyone used OASIS to receive mail using a NON-Demon internet provider.

On a related note, the docs for Oasis 1.30 say that it is no longer Demon specific. I guess that's technically true, but I still had to go through STARTUP.NOS and edit the whole thing to remove all the Demon stuff Using the set-up in Oasis only changed a few lines of Startup.nos. I also had to edit the active.dat file, because Oasis didn't change it to my news server. I think it tried, but wasn't completely successfull because the first line still had demon, etc, and my news server was at the end of the file, as if it had just been appended.

Can ANYONE help in ANY way??? (or am I gonna have to buy a friggin' PeeCee just so I can hook up to the Internet?)

many thanks in advance!

2935. Re: Windows on Supercharger

Newsgroup: comp.sys.atari.st
Date: 1995-08-27 00:00:00 UTC
From: maberg@xs4all.nl
Message-ID: <3041289c1179cb60@xs4all.nl>
Source record: 160086

IIRC the supercharger was an XT, 8086 processor at 8 MHz.
In that case I think trying running any new software like PPP, windows,
word 6, WP 6, etc. is futile.
1 MB won't get you anywhere anyway, even if the processor was newer.
CD-Roms won't work. Dos-drivers will not find the hardware they expect.
Remember comparable PC's are obsolete for several (5? 7? 10?) years now.
Not without good reason.

2936. Re: Falcon and 28.8 Modems

Newsgroup: comp.sys.atari.st
Date: 1995-08-27 00:00:00 UTC
From: kulabocca@aol.com
Message-ID: <41rego$mbh@newsbf02.news.aol.com>
Source record: 160087

Thanks everyone for the suggestions, I have followed all good advice (STalker set to TT/MSTe Modem 2 Port. 38400 baud. RTS/CTS. DRVIN and SCC installed in order and set according to previous posted settings. Not even running CPX, so that should not be the problem. Yes, even running FPATCH2. No other autoboots or cp's running.)

Unfortunately, the modem is still not working properly. What's strange is that this same modem works fine on a mac 8100/80. I forgot to mention that when using the 28.8 on the falcon, I can connect with remote modems at 300, 1200, 2400, and 9600 baud rates without any noticeable problems. Removing the 28.8 modem and replacing it with the a Sportster 14.4 (and without changing any system settings) I can connect at 14.4 with no problems.

Perhaps what I really need is to see an example of Claes' actual modem configuration. Claes, would it be possible to capture an ATI4 command from ya'?

Thanks again everyone for your much needed help!

Kula

2941. Problems with Chimera

Newsgroup: comp.sys.atari.st
Date: 1995-08-27 00:00:00 UTC
From: ping1030@ping1030.ping.be
Message-ID: <809485356_OASIS_@ping1030.ping.be>
Source record: 160148

When using CHIMERA I accountered several problems.

1) During unpacking the floppy's I get a few times the following
message. gzip: stdin trailing garbage ignored
gzip: stdin interal error, invalid method
tar: child returned status 1
These message appears when I try to unpack the following archive's
archive 2
archive 3a, 3b
archive 6a. 6b

Is this meaning that not all the file's are unpacked?

2) When I try to download a file from a anonymous ftp-site I get the
message: "access denied: 421 services not available remote server
has closed connection"

3) I can't save a www-page. If I try to save a page I always get a
error message.

4) It is not possible to disconnect through the normal way.
When I do try this I get the message "kill: can't find kill".

5) Most of the time I can't quit X-windows with the Fvwn exit command.
When I try this to leave X-windows this way the computer sometime's
hangs up.

Is there somebody out there who knows how I can solved these problems.
Please keep in mind that I'm a complete novice with mint, mintnet,
unix, x-windows etc. These things are completely new to me.

It was me, Brian. Turned out to be a corrupt prog. file from the archive. I can quite see how interruptions from a screen saver could muck things up though.

This is a plea...
A suggesstion...

Can someone look into developing a software based Ram Doubler for the ST and STe? If it's possible...please write it, and charge good money for it.

See...I've been watching the computer market for years now...and have noticed that no matter what platform you get stuck with...it's only a matter of a couple of years before you can't get software for it anymore. Yes...the PC clone and Mac worlds have this problem too (looking at the old 286 clone in the corner that isn't even plugged in [it's my room mate's] thinking of the 2 year old Mac SE up in the music studio and the thousands of dollars of software for it that is barely if even supported now that almost everything requires System 7...which it can't run).

Any way...I'm a medium to heavy Atari User...I do Word Processing, DTP, MIDI, FAX, Music Scoring, Database, Spreadsheet, Telecom, and some Color Gfx to Video work on my STe. This machine does a great job at each of these tasks so there is really no need to go out and buy a $3,000 Mac or PC, and another $3,000 worth of software simply to arrive at the same sort of problem I have with the STe...hard to find, barely supported software.

If I could only get another 2 or three meg, and some decent internet software (stable and efficent...not necessiarly glossy and colorful), I'd be set for the next 3 to five years, and will actually have had a chance to wear out my second ST (it's only a year old, my old one would only hack up to 2 meg so I traded it in for this STe). Yeah, I know that if I looked hard enough I might find a TT or Falcon used for six or seven hundred dollars, but I shouldn't have to. Not when all I need is a simple little ram doubler that loads up at boot for around $150...that is...if it's possible on the ST/STe.

Oh well...here's my wish list.

1. A resaonably fast software based Ram Doubler

2. Internet Package that runs under MultiTos/Geneva/Majic/GDOS of your choice
Includes Graphical Web Browser in all Atari Resolutions (be creative here)
Includes Mail management
Includes News Reader
Includes or is compatable with gem text editor
Includes a flexable/coustomizable telnet/rlogin client (offers page pause,
Includes a system log of what you've done/when capture, and macros)
Includes FTP, XYZ transfer, kermit, ASCII, etc...
Includes A simple but useful remote mode

Nice extras would be clients like gopher, netsearch, etc...

3. A 16 bit sample editor/librarian that can send and recieve via SMIDI/SCSI.

These things would make this Atari user quite content with his stock 1040STe.
A TT or Falcon would be major overkill considering these non hacking options
are all I'm (and a lot of other ST users) crying for.

None of these applications are really out of scope for the ST...
Some sort of compression technique for the ram doubler seems sensible.
A web browser doesn't seem impossible either...we've been looking at gifs
on our ST's for years now...and HTML/Hyper Text was practicaly invented
on the Atari platform (NeoDesk and Geneva Uses it!). No...we can't
expect it to be as glossy as the High Res of NetScape or Mosaic, or even
to be set up in the exact same style of interface...but it could be solid
and functional. PPP and Slip is also possible...I'm connected right now
via MiNT...but I can't seem to get all the unix apps working...(NO PID),
this MiNt thing is very frustrating and time consuming...I don't know how
to write and compile source :/ As for the SMIDI/SCSI...this shouldn't be
impossible either...or even too difficult...surely the ICD, Supra, and Atari
SCSI interfaces meet SCSI standards...or they wouldn't run SCSI drives.
PC cards...made to the same Standards don't seem to have any problems
doing SMIDI sample dumps.

I hope someone out there is listening...not just Atari developers...but
all software developers. This gripe and wish list isn't confined to
Atari owners...it spans over almost 15 years of high teck rip off...from
TI-994A, VIC20, Atari 800, PC Jr, clear up to todays super PC. 7 out of
10 people who purchase a computer, for home or for work, have to finance
it in some way...it's usually fine hardware...quite capable...but they
find that once it's paid for, it's hard to get the gas that makes it go.
Kinda like buying a new car on a 3 year financing, and after 1 and a half
years of driving it...you learn the new cars only burn moonshine, so all
the gas stations quit pumping gas. Guess you're forced to either walk,
or buy a moonshine burning engine :/

>PeeCee just so I can hook up to the Internet?)

This sounds exactly like the crap I went through a couple of months ago
trying to get my Atari connected with my server. I had outgoing mail,
incoming news and ftp. But I discovered an answer and I bet it will sort
you out to. I uploaded a file to demon to help out people who might find
themselves in a similar position. It is a version of nos with POP3 and news
that works with my server. I've had quite a few people follow up to me who
finally got their connection working. Go to Demon and look in
pub/atari/ka9q/contrib and download nos_pop3, copy it into your Oasis
folder replacing the NOS which is currently there. Add these commands to
your STARTUP.NOS

pop user <your user id> <yourpassword>
pop mailhost <your mailhost address>
pop mailbox <your user id>
pop timer 300

(Dont include the angle brackets by the way)

I have to do another couple of things to do to make it work once online.
First I have to use the command: ifconfig sl0 ipaddress 193.160.131.xxx
This is because my server allocates a different last 3 figures to the
address each time I log on, and I have to put that in.
Second I issue the command: pop kick (this kicks incoming mail)
Third I issue the command: nntp kick (this kicks news in/out)
Fourth I issue the command: smtp kick (this kicks outgoing mail)

If you dont need to use the "ifconfig" command with your server then you
can probably include the kick commands in your STARTUP.NOS file

Anyway it is not as difficult as it sounds because I have all the commands
programmed as macros on the F keys, so it is all done in less than a
second.

I hope this sorts you out... it is great when you finally see all that mail
come in automatically, and can contribute to news properly. Mail me if it
works... mail me if I can help further. It all works very well with Oasis
which is improving all the time. Good luck.

Regards,

Richard.

2949. [A]CoNnect:Confused Zmodem

Newsgroup: comp.sys.atari.st
Date: 1995-08-28 00:00:00 UTC
From: bjr@EbiCom.net
Message-ID: <41s70o$t45@Einstein.EbiCom.net>
Source record: 160004

I remember reading a day or so ago that someone was having a problem with CoNnect's internal Z modem. I've recently downloaded this term to give it a try, and made several successful Zmodem transfers with no problems. That is, until I downloaded a really large file that was estimated by Zmodem to take some 8 minutes or so on a 14,400 modem (actually several files in a batch). The transfer started burping and complaining about Garbage counts, then quietly exited. By accident, I caught a quick split second flicker of the screen, and noticed that my screen saver (which was set for 5 minutes) had tried to activate itself. Before Dawn is the exact screen saver in question. I went to the screen saver options and set it to not only look for mouse movement and key strokes, but to also listen to the modem port. It's been working fine ever since. So...ya might want to check your screen saver and other desk accessarys before giving up on CoNnect's Zmodem.

Brian

>
> /Anders

Yeah, sure (and you don't need to compile the compiler :). You have just to compile all the libraries under linux (especially the crt files are needed). The assembler code generated by 2.6.3-mint is exactly the same as 2.6.3-linux68k code. So the only difference is the format of libraries and startup code. So for me it's easier to compile and keep new format of libs than another version of same compiler.

regards,

Simon.

C-Lab still intend to release a Falcon with a more powerful CPU but as yet
I do not know which one. They may even jump straight to a 68060 (this is
one of the possibilities I have heard being discussed). The first of these
machines is planned as a rack mount for recording studio use but
tower/desktop versions may follow

Hello, fellow Canadian/Atarian!
I have an STe with TOS 1.6. See previous posting "TOS question".
The thing I noticed most was that with the librarian program for
my Akai sampler, when I was trying to select the sample number to
load or get, the STe would register more than one mouse click for
each actual click. This meant that I would have to go around and
around the cycle of 16 memory locations, two or three at a time,
until it happened to land on the one I wanted. The STe Fix prg
seems to have eliminated that. It's also a weakness in the
program, that it doesn't have keyboard equivalents, so that I could
type in the correct number.

Could it be a fault with the modem? (But the fact that it works OK on a Mac suggests not).

I know that some 28.8. Sportsters had a faulty chip that produced problems like yours, and the chip had to be changed. I don't use that model, so I can't remember details, but maybe someone else will remember.

The DEMON NOS041/2 version uses the IHAVE mechanisme to post articles - it first asks the server if the article is not already there. This mechamism is usefull in dialogs between servers, between client-server it is useless. Therefore most providers expect a POST command. This is implemented in the NOS_POP3 version of NOS042 at atari/archive/umich/edu /atari/ .This version has been compiled by a person who does the good works in silence. In the banner you will find JWC.

>with them it was because of POP3, but my provider has SMTP, so I don't
>know what's going on.

Sometimes SMTP is used to send mail and POP3 (or 2) te receive - as in my case.

>
>Don't I have to specify my username somewhere in order to
get my mail?

Try the NOS042_POP3 version. My user ID is allmidd (see my address). If you specify your own user ID in the user menu (SETUP) of OASIS AND in the POP3 commands in STARTUP.NOS it should work if your provider has POP3. The command lines in STARTUP.NOS read as follows:

```
# Set up POP commands if POP implemented
# To use POP, uncomment these lines. Fill in "pop mailhost" with
# the IP address of the station serving as your POP server.
# The "3" behind the IP address denotes POP3. For POP2 use "2"
# Fill in the
# "pop mailbox" name with your hostname, i.e. your call. The "pop
# userdata" line needs to have your hostname, followed by a password
# (in my case the password I use to log on, no <> of course)
# (as negotiated with your mail server). "pop timer" sets
# how often, in seconds, to query for mail.
pop mailhost 193.78.33.42 3
pop mailbox allmidd
```

pop userdata allmidd <password>
pop timer 600

When you are connected, issue the command "POP KICK". When noting happens there is no mail, otherwise you get a message.

Do not forget that NOS042 has some batch facilities for FTP (see doc's at FTP.DEMON.CO.UK)

>But looking through the startup.nos file, my username is nowhere to be found >
>I'm at my wit's end...I want OASIS to work so badly, but I seem to
>have nothing but trouble. I'm especially concerned about the mail problem.
>Has anyone used OASIS to receive mail using a NON-Demon internet provider.

I did and do receive mail

>
>On a related note, the docs for Oasis 1.30 say that it is no longer Demon
>specific. I guess that's technically true, but I still had to go

This is certainly not true. To avoid rewriting DIAL.TXT by OASIS use DAIL_1.TXT (or any other name) for the dialup file. Do not forget to change the command line in STARTUP.NOS refering to DIAL.TXT

OASIS is a fine prg we have all been waiting for but:
- it is centainly not as versatile as the authors claim and
- it is certainly not bugfree i.e. foolproof.

Good luck

Johan

> Sorry - you're right, dumptos.ttp doesn't work... I haven't got round to fixing
> it and putting it on our server, but you can use WINX instead (winx21.lzh).

You could also use the devpac MonST prog and use save binary option (B? S?) and save the following memory:

Tos Start End Size
<1.4 $fc0000 $ff0000 192K
>=1.4 $e00000 $e40000 256K

I'm not sure about any new TOS ROMS for falcons etc... (which wont work anyway) but these addresses should work for normal ST TOS ROMs.

Unfortunately this isn't easy :-(. I borrowed a Supercharger to
investigate this (and some other stuff) a while back. I forget the
exact details, but basically you would need MSCDEX on the IBM side,
plus a device driver on that side that would talk across the supercharger
interface to some software on the Atari side that would issue the
appropriate SCSI commands. I think it's do-able, but I don't think
the marketplace is there ...

Sorry to have missed this question before. MagiC uses a different method of dynamically allocating space for folder (and file) handles. It normally has no problem maintaining system space for these, but it comes with ADDMEM.PRG, which allocates more space (I don't know how much). I have hit the MagiC dialog that warns me to use ADDMEM only once, when running a search app through a CD-ROM; since that time, I merely added ADDMEM to the auto folder, and have not seen that dialog again, even when running CD-ROM searches.

You need HSMODA06 to eliminate the rts/cts bug in Tos so you'll get the
best out of 19200. If you fit a simple hardware mod you can run the
serial port at 38400.

HSMODA06 and the info for that patch are available at ftp.demon.co.uk in
pub/atari/comms/

: When and if I do the swap, would I be able to install the 1.06
: in one of my other machines STf or STfm? Would there be any
: advantage to this?

There are patches available to solve the problems in 1.6 and thus make it the same as 1.62 so if your set of TOS isn't socketed it's probably not worth the hassle of playing about with a soldering iron trying to take them out. If they are socketed then you might as well swap since the medium res bug on it's own is a pain in the arse and to have it permanently in rom is a slight advantage so you're not carting bug fixes around.

You can't put 1.62 tos chips in an STf or and STfm since they have different addresses and wouldn't work on top of that there might be 6 TOS chips instead of 2 in the later machines and they're probably not socketed.

If you want to upgrade the TOS in your machines you can consider 3 main rom options, 1.4, 2.06 or Magix blown onto eproms. Depending on your needs I'd say it's between 1.4 or Magix since Magix is better than 2.06 for serious apps and you can't run the majority of games on either 2.06 or Magix. But then again, 2.06 is by far the easiest TOS upgrade to get nowadays soooooo....

] 1. A resaonably fast software based Ram Doubler

Not possible. On the Falcon or TT, _maybe_, but doubtful. On an 8Mhz
ST, you've got no 030, and so no memory protection etc, and it
certainly isn't quick enough to compress data into & out of RAM on
the fly, and still be usable.

] 2. Internet Package that runs under MultiTos/Geneva/Majic/GDOS of your
] Includes Graphical Web Browser in all Atari Resolutions (be creative
] Includes Mail management
] Includes News Reader
] Includes or is compatable with gem text editor
] Includes a flexable/coustomizable telnet/rlogin client (offers page
] Includes a system log of what you've done/when capture, and
] Includes FTP, XYZ transfer, kermit, ASCII, etc...
] Includes A simple but useful remote mode
] Nice extras would be clients like gopher, netsearch, etc...

Oasis claims to do a lot of this, but by the sounds of it is full
of problems, a pig to setup, and awkward to use when you manage to
get it going anyway. Hopefully ICE will fix this, if/when it's released.

If you don't mind losing a partition and a lot of hair after tearing
it out in frustration, you can try running MiNT+Minix+MiNT-Net+Chimera
etc. A real pain to get going, but trying the TAF distribution disks
may make things simpler, apparently the version on micros.hensa.ac.uk
has a problem somewhere in it though....

I wrote a small BASIC program to do this which was basically a shell for the
supplied routines. Unfortunately, I managed to fry my cartridge port before I
got it to work. (The ST does not boot now with anything in the cart port - any
ideas folks?).

All I am saying then is that it is possible, using the supplied code on disk.
Good luck!

2978. STonX

Newsgroup: comp.sys.atari.st
Date: 1995-08-28 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <41t6nk$5a7@batph8.bnr.ca>
Source record: 160033

I finally got my TOS 2.06 dumped and sent to my HP-UX machine at work.
Since I use an NCD xterm, I had to have my administrators install the
ST fonts which were extracted from my TOS image.

I fired off stonx.hpux and boom! I got a screen with the friendly Atari
logo and the familiar (to the latter TOS users) RAM check. The first
thing I noticed is that while the STonX window was active, the network
activity light on my NCD keyboard stayed lit...so STonX appears to be
network intensive.

Screen redraws are slow and understandable. I tried some of the benchmark
programs on the defaultdisk. I found that the system died during the graphics
benchmarks, but the CPU benchmarks were interesting. I got almost %500 over
a stock ST, I think %140 over a stock Falcon, and a disappointing %50 over a
stock TT. Nice to know my TT is faster than a HP RISC processor (big grins).
(that was a joke for you sarcastically impared persons).

I could not get the hard disk image to work for me, and I found the mouse
movements were annoying. What you get are two mouse pointers...the regular
X pointer, and the ST pointer...and they do not align themselves, although I
found a way to get them to do that.

In short. I am impressed. I look forward to seeing this product improve.
I find it currently crashes too much for regular use, but it is novel to
show people here at work.

Now, if I can just get STonX on my Linux68k system. Then I could run Linux
on the STonX emulator running on my Linux system...

So the Link requires the attached SCSI device to provide TERMPWR for the Link as well as itself? I supose something has to supply TERMPWR and if it isn't the Link - it must be the SCSI device?

Fair enough though.

BTW my ICD AdSCSI+ doesn't supply TERMPWR either - so I supose its in the same boat.

:-)

I'm 99% possitive this is *not* possible. The 68000 CPU does not have the memory management facilities which allow you to implement Virtual Memory which AFAIK is what a Ram Doubler is really.

Of course it *is* possible to build a machine with a 68000 chip which does have some sort of Virtual Memory. IIRC the SUN 1 was such a machine. This had extra hardware to make up for the deficiencies in the 68000 chip. Even without extra hardware - it would be possible to build Process Swapping into the OS. This might help out a bit - but its very slow, not all that flexible and requires a good hard disk. I don't think writing a version of TOS/MagiC which implements Swapping is practical at this late stage in the ST(e)'s life.

A 68010 doesn't help either (before somebody suggests it ;-) as it still lacks a proper MMU chip. A 68010 + proper MMU combination might be able to be used - but this wouldn't be a drop in replacement for the 68000 (even though the 68010 on its own is (mostly)).

> (looking at the old 286 clone in the corner that isn't even plugged
> in [it's my room mate's] thinking of the 2 year old Mac SE up in the
> music studio and the thousands of dollars of software for it that

Both the 286 and Mac SE suffer from the same lack of memory management facilites which is why they are obsolete like the ST(e) is.

If you have a TT or Falcon (or even a 68030/68040 upgrade) then its a different and more possitive story. There are a couple of commercial products which do what you want - and Linux/68 implements proper Virtual Memory for free.

All IMHO and AFAIK

:-(

Roland.

Sorry, my mistake. I just got confused by the awkward 'spelling' :
TOS 1.06.2 instead of 1.62 .
I still cannot get used to those changes Atari made afterwards in the
numbering (for no apparent reason).

Does this also mean we can call M$ Windows95 Windows 0.95 instead ? ;-)

TOS 2.06 does not have known leaks in its internal static memory, but it
still uses a memory block of a given size. If you work with an application
which opens a lot of directories and/or calls Malloc() a zillion times,
then you will have to use the FOLDRxxx program (or any equivalent) to
extend the internal static memory area.

MagiC's predecessors used a different program for the same purpose.
I'm not sure whether MagiC still has the same kind of limitation,
though.

Ok, thanks, I was not asking about Linux68k but Linux (x86) the original
Intel PC version, but I think it answered my question anyway, it should
be possible to build the crosscompiler since there is a Linux (x86) target
in the original gcc source. Is that right ?

if there is such a target, then you can make te cross compiler. In any
distribution of gcc, you will find good docs about porting gcc/making
cross compilers.

It was fixed in all TOS versions starting with 1.4. You might still need to _increase_ your folder/memory pool slots, but that's not a bug, but simply how the operating system works (not unlike DOS, from what I'm told).

Source record: 160051

I have two 50meg Gastiner SCSI hard disks for my Atari STE. Each
has a controller built in. To link both to my Atari at the same time,
I need to change the SCSI ID of one of the drives. Does anybody know
how to do this? I have read the manuals and it says "just change the
jumper leads inside the drive". I have opened up one of the drives and
found no leads to change!!

Any help would be greatly appreciated because I am fast running out
of disk sapce :-)

Thanks in advance - Robert.

>RMS

You should always use a serial port baud rate higher than the line
speed of the modem. Thus, 19200 (or higher) is correct. Forgive me if
I have misinterpreted your question, but I believe that you may be
under the common misconception that one needs a DTE speed of 14400 to
use a 14400 baud modem. This is /not/ so.

Hope this helps.

g> invest in a second hand tape drive anyway, when I can afford it!)

No I don't think the effort would be worth it either .. the reason I asked
was to clarify that you were copying from Minix to TOS filesystems. This
inscreases the likelihood that it is the stacksizethat needs fixing to a higher calue IMO.

g> Thanks for the hint though - I'll try changing the stacksize when
g> I've got some time to sit down with that pile of disks again :-)

I'm using a 28800 on my Falcon, and i have no problems at all. Use connect
and set the port at 115000 baud, everything is working just fine.

The modem is a Hornet Legato V34

Source record: 159958

Troy Carpenter (troyc@bnr.ca) wrote:
: I fired off stonx.hpux and boom! I got a screen with the friendly Atari
: logo and the familiar (to the latter TOS users) RAM check.

Oh, you scared me for a while there...
: The first
: thing I noticed is that while the STonX window was active, the network
: activity light on my NCD keyboard stayed lit...so STonX appears to be
: network intensive.

It is - it has to update the screen frequently - this is done by sending
it over then network (of course).

: Screen redraws are slow and understandable. I tried some of the benchmark
: programs on the defaultdisk. I found that the system died during the graphics
: benchmarks, but the CPU benchmarks were interesting. I got almost %500 over
: a stock ST, I think %140 over a stock Falcon, and a disappointing %50 over a
: stock TT. Nice to know my TT is faster than a HP RISC processor (big grins).
: (that was a joke for you sarcastically impared persons).

Did you take the 100HZ Timer C into account? If not, those rations should be
divided by 2 (sorry).

: I could not get the hard disk image to work for me, and I found the mouse
: movements were annoying. What you get are two mouse pointers...the regular
: X pointer, and the ST pointer...and they do not align themselves, although I
: found a way to get them to do that.

Did you try the -vdi option? Since you installed the fonts, it should work.
Its benefits are: 1) faster graphics, 2) little or no network load, 3) only
1 mouse cursor (the X one), 4) slightly faster emulation.

: In short. I am impressed. I look forward to seeing this product improve.
: I find it currently crashes too much for regular use, but it is novel to
: show people here at work.

Could you describe the crashes a bit more accurately? The way STonX is written,
some (ST-)crashes are fatal, but that'll hopefully change in the next version...

: Now, if I can just get STonX on my Linux68k system. Then I could run Linux
: on the STonX emulator running on my Linux system...

I doubt that, STonX emulates only a 68000 (no PMMU or FPU, which Linua
requires).

Regards,
Marinos

Well I use a Falcon/Hayes Accura 28.8 but I did have a few problems. I use HSMODEM06. The two progs you need in your AUTO folder are DRIVIN (the serial driver loader) and SCC (the program for the SCC chip!). You then should set the baud rate to 150 (theres a table in the manual) using the Control Panel CPX. HSMODEM intercepts this and hey presto your actually working at 115,000 bps. If you get the modem to report the connection speed modem-DTE you'll know its working. The port itself is quite cabable of running at full speed, only the ST needs its ports modifying for higher speed.

I also have FPACTH2 to fix the bcomap bug. Hope this helps..

The U is for the Unified (?) file system. All filesystems should be accessed
through the U "drive" (when using MiNT).

>
> I've looked all over for a FAQ on mint...and have very little documentation
> on the stuff...know of anywhere I could find such animals?

Currently I'm working on merging the Chimera (WWW) and KGMD (UNIX) package
for my TT. I got this stuff from a BBS here in Sweden (a LOT of files),
but I guess you can get it from other places as well. Anyone who knows ??

From: dhong@wam.umd.edu
Message-ID: <41v8tm$kk2@cville-srv.wam.umd.edu>
Source record: 159967
Cross-posted to: comp.sys.atari.st,

I am looking for SF314 drives in good working condition, considered that
I spent $15 on a working 520ST + SM124, I am not going to spend
a fortune on it. About $10-$15 is my price range. Power supply
is not a must, (including in the $15 deal is 1 SF314 and 1 354
with power supplies, but both drives do not work).

Anyway, if you have one laying around, let me know.
(BTW, if you have a working 1040ST that you want to get rid
of, let me know too.)

Thanks,
Sze

VME vga card for ATARI MEGA STE???
How am I gonna do that, I allready have a card but it is ISA, are there other ways to fit it into my computer? And what about the software? NVDI et4000 or some shareware? Or is it really necessary that I buy the VME card and NVDI et4000 from ACN in Holland? That would be than about $300... a little expensive, than I'll better wait for the mighty ATARI MICROBOX wich has the best specifications I have ever seen!!!
And my memory, can I put normal 30 pins simms into the sockets or do I need to by simms "specialy" made for that computer. For the moment I have simms 4x1MB but I want to change them with 2x4MB can I just do that?

>
>Do you know what version it was? Version 4.2 came with my Replay 4 cart, I've
>been wondering if there is a newer version floating around...

Well, the copy floating about on my hard drive is Stereo Replay
v.1.02, for what it's worth. Whether it'll work with the older
cartridge I really don't know. BTW, after a quick hunt through my
floppy collection, I can confirm that it was on the cover disk of ST
Review (of blessed memory) number 22. I'm pretty certain one of the
other UK magazines gave it away, too.

>Also: A friend
>of mine wants some software to play WAV's with, I use the Replay software to
>pay WAVs, is there something better?

Sorry, can't help you there.

>I've been wondering if it would be leagal

Would have thought this was highly *illegal* if you kept a copy, too.
It would be OK if you sold or gave him the whole package, otherwise
it's piracy.

3033. Protext Upgrade

Newsgroup: comp.sys.atari.st
Date: 1995-08-29 00:00:00 UTC
From: bede@newshost.li.net
Message-ID: <41vj5t$fep@linet02.li.net>
Source record: 159977

Does anyone have information on the content of the new Protext 6.6? The recent review in Atari World said 'buy it' without saying what was new in the upgrade. As an avid Protext user (on TT and MacPowerbook via MagicMac) I'd love to upgrade to this wp that's better with words IMHO than anything else on either the Atari of the Mac. But, as a matter of principle, I like to know what I'm getting first. I've asked Compo, but they're not saying.

3034. Happy Windows 95 (Wait Is Over)

Newsgroup: comp.sys.atari.st
Date: 1995-08-29 00:00:00 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <4202dp$8jp@golem.wcc.govt.nz>
Source record: 159978

For all those who look behind the hype and know what a hack of poor
coding Windoze .95 really is....

By Jim Conner (jc30@cornell.edu)

Happy Windows 95 (Wait Is Over)

with apologies to Yoko Ono & John Lennon

(Happy Windows Bill)
(Happy Windows Microsoft)

So this is Windows
And what must you do
Another big upgrade
Hard- and software too
And so this is Windows
I hope you have fun
Spend hours and hours
Just to get it to run

A phenomenal upgrade
The hype and the plugs
Let's hope it's a good one
Without any bugs

And so this is Windows
You've waited so long
A superior product
Bill Gates can't be wrong
And so happy Windows
Just pray it won't bomb
Can't talk to the modem
Or the new CD-ROM

A phenomenal upgrade
The hype and the plugs
Let's hope it's a good one
Without any bugs

And so this is Windows
All the old drivers fail
Got the Microsoft Network
Only can't read the mail
And so happy Windows
But must take it back
Can't get it to work right

Try OS/2 or Mac

A mind-boggling upgrade
The hype and the plugs
It isn't a good one
Has too many bugs
Wait is over, but who wants it
Wait is over now

Happy Windows

>
>Cheers,
>Frank.
As you will have noticed, I di say it was 1 of 3 libraries that I did not deal
with. The other 2 WERE the co-signants of the letter(I think Merlin is OK), I
have dealt with all of
the and they all did offer a *FANTASTIC* service and I can and will not remove
the credit for that. However more goes on behind the scenes than many people
know and I object to the high prices that they charge and so do not use them. I
simply CAN NOT go into details about LAPD for legal reasons as i'm sure LAPD
wouls start threatening legal action at me, I know it sounds like a cop out and
if you like the service a library gives you then use them by all means.
I find it more than easy to believe LAPD do not make a profit and this
worries me. They have so many adverts that I can not understand how on earth
they even begin to cover costs, this is why they treat compilers so badly. The
big libraries would rather supply stuff on 3 disks rather than on 1 and so they
loose money. And so they make up stories about people leaving docs and important
info out of the compils. Admitedly this used to happen often but now it is
frowned upon by the whole PD community and many people will simply (and rightly)
refuse to spread it. There are many good compilers who DO keep ALL docs on the
disks and want to keep the PD scene going with people getting PD for free as it

shoud be.
I have over 1000 disks in my PD collection and 800 of these were
completely FREE. I have not bought a single disk in over a year and yet my
collection has had a 500 0ncrease in size. And so I do not deal with ANY
library for money but if you do want to get good value for money then try Power
or Asciilum.

This .sig does not waste space-But I do, by my very existence.

PS!!! 155.198.1.40 is more reliable!!! - (uni-paderborn, GERMANY)

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
--------------------------------
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
```

9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available
at your site. If you don't, ask your local system operator how to transfer
files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

- -

Can anyone tell me the limitations of what you can and can not do with this Software emulator when you run it on a Falcon, What kind of RAM it requires,
if anyone has run Windows (yes I am sorry for asking) and what it is good for.

Thanks.

Hi Brian,

BR>Can someone look into developing a software based Ram Doubler for the
BR>ST and STe? If it's possible...please write it, and charge good money
BR>for it.
[...]
BR>but I shouldn't have to. Not when all I need is a simple little ram
BR>doubler
BR>that loads up at boot for around $150...that is...if it's possible
BR>on the ST/STe.
[...]
BR>None of these applications are really out of scope for the ST...

Yes, the Ram Doubler is!

BR>Some sort of compression technique for the ram doubler seems sensible.

The problem is not the compression technique, but the operating system and
memory management of the Atari. If a program requests the OS to allocate memory
for it, it gives just the desired amount to the OS and gets back the start
adress of a RAM area to use. Then the program may freely access this RAM area,
wihtout jumping throug OS routines. This makes a Ram Doubler impossible,
there's no way to supress the user program's RAM acess and compress/decompress
the data. For there's no difference between data and instruction RAM, you may
not even differ what you may compress or not.

I'm sorry to say that a RAM DOUBLER is NOT possible for any Atari.
If it was possible, someone would have written a doubler already. Especially
demo coders like me would have had something like a ram doubler soon.
If you already got 4 Megs, you have to buy a TT or Falcon. If not, buy SIMMs.
This is the only way to get more memory.

BR>Kinda like buying a new car on a 3 year financing, and after 1 and a
BR>half
BR>years of driving it...you learn the new cars only burn moonshine, so
BR>all
BR>the gas stations quit pumping gas. Guess you're forced to either walk,
BR>or buy a moonshine burning engine :/

Well, unfortunately that's it. :-(

CU,

Gerrit

Yes, I think I can help you there...

Way back when I had a PCjr, I had to grease the drive rails to stop the head from vibrating...

I used a teflon based oil from Radio Shack (a big electronics chain here in the US). It was called the precision oiler and did the trick.

Perhaps this might be of use?

Ari

On 25 Aug 95, Al Fasoldt shot this through the ether to All ...

AF> You need more physical RAM. That means you'd require a TT or a Falcon.
AF>
AF> There are, as yet, no RAM doublers for the Ataris, but that dfoes not
AF> mean it can't be done. I know of one talented developer who says he

I may be mistaken as to your meaning concerning what you're calling a "RAM doubler" above BUT, there's a board available from Marpet in the UK which allows the RAM in Mega ST's and standard STe's (they weren't sure about MSTe compatibility) to a total of 12MB. The card uses the original 4MB of SIMMs plus 8MB of it's own. Marpet can be reached at +44-1423-712 600. They also make the Forget-Me-Clock.

Regards,
Tom

I just purchased some fuses for my SM124 <grin>. When attached
to my Falcon I too see a "sand whirling in a glass of water"
effect, but no bands. I think that this topic was covered a while
ago and mabey someone will repost what was discussed. The SM display
looks fine on my Mega and ST. I have an old NEC gs, which works
well on the Falcon as does my '3D.

MvdB> I don't think 1.06 will work in a STf(m). TOS 1.06 was a TOS 1.04
MvdB> with the necessary changes for the STe.

And TOS 1.62 was the version released about 2-3 months later with a number of important bug fixes. Among others, the ability to save the desktop in medium resolution, if that rings a bell. These two TOS should actually be termed "1.06" and "1.06.2" as the ealier Atari convention (caused by some obscure fault in the operating systems) reversed the order of the numbers after the first decimal point. I.e. TOS 1.4 was actually TOS 1.04. However, the ".6" TOS'es are generally refered to as "TOS 1.6" and "TOS 1.62".

I believe you're correct concerning the use of both of the above TOS versions on STF(m) machines. They just don't want to play without the STe's extra hardware. TOS 2.06, however, runs happily on these machines. They just don't get the extra benefits intended for the (e) series.

> but it would run most of the Windows stuff I borrowed to experiment with.

What proccessor is in the SuperCharger? 3.1 added support for "386 Enhanced"
mode, there is no point in running 3.1 on anything other than a 386 or better.
Stick with 3.0 on 286's and lower.

> 4. What is the latest DOS you've managed to get installed on your
> SuperCharger? I'm still using DOS 4, and wondering if it is possible
> to upgrade to the latest DOS.

DOS 4 is buggy crap, get DOS 5, or 3.3. If you're planning on running Windont
then 6.x is recommended.

On 68000, no way. But I don't see any reason why a Falcon, TT, or PAK-outfitted

ST/e coulden't do it!

>Memory for free.
>

Yes, I too am very sceptical about the possibility to write such a piece of
software without proper hardware to support it.
But _one_ program got it implemented very well, namely Cranach Studio.
It uses virtual RAM on any ST and is quite stable and reasonably fast.
This proves it *can* be done, though it is really very difficult.
I guess the sourcecode will remain a mystery to us all, this program was
sold commercially...

BTW I think a ram-doubler is not the same thing as virtual RAM.
A RAM-doubler uses realtime compression AFAIK.
With an 68000 @ 8 MHz this is impossibly slow.

A Question too...
I heard some of you talk about a program that installs virtual RAM.
I don't recall the name right now, but I looked for it on many ftp sites
(grep-ing indexes) and could not find it. Have I misunderstood it or...?
I know of both Outside and Vram but is there anything else available ?
I am in the fortunate (?) position to have some 300 MB free harddiskspace
but only 6 MB ram. Impatiently awaiting my order of 2 * 4 MB SIMM's...
(why are some SIMM's (or ramcards) so damn incompatible...)
Any pointers are greatly appreciated.

>Please Answer to either arneri@login.eunet.no or andreasr@rol.bbs.no

Gemview can save in some other formats too, but none of them are compressed
as good as GIF or JPEG AFAIK. You need a different approach :
ZIP the TIFF's !
If I'm not mistaken, ZIP compresses just as well as the algorithm in GIF does.
With any luck you'll get pictures of up to 5 MB on a single HD floppy.
BTW, if you don't know already: it's STZIP26.*, on all better ftp sites.

You are better off selling your PC though ;->

It emulates a 286 at NI ~1, i.e. the speed of an original IBM XT @4.77 MHz.
It gives you 640K RAM, runs in 640x480 in 16 colors and uses virtual
harddisks (it was originally developed for Mac, and it seems they've
kept this virtual drive system although it's not necessary: The TOS
filsystem would be perfectly compatible.) This is a shame, because
this limits the exchange of files between DOS and TOS to the old way
via floppies. It can only read 720K floppies, BTW.

I haven't tried Windows (I won't) but it could run, perhaps. What it
is good for? For fun, and for running PC programs that don't exist in
an Atari version.

No , it's not possible...I did send the author a request for this but didn't
evan get a reply...though I understand he's very busy at work.
The best I've managed to come up with so far is to set my modems timeout
setting to 2 minutes , so after 2 minutes of nothing happening it hangs up
the line....unfortunately this rarely happens usually in the 2 minutes the
news server kicks in again with more mail...:-<

3062. MIDI / Forth / Atari ST

Newsgroup: comp.sys.atari.st
Date: 1995-08-30 00:00:00 UTC
From: andy@access2.digex.net
Message-ID: <422l6k$bhl@news4.digex.net>
Source record: 159856
Cross-posted to: comp.lang.forth,comp.music,comp.sys.atari.st

Hey, has anybody got any experience or clues for MIDI applications in Forth, preferably on an Atari ST? I've just set out to explore using Forth to (a) map my playing (MIDI in) to notes/sounds (MIDI out), possibly with various kinds of transformations; (b) generate/compose music/sounds and play them (MIDI out); (c) analyze or "listen" to my playing (MIDI in); etc... I decided to look at Forth because I've hacked it a little in the past, it looks to me like it would be relatively easy and even fun (I'm sick of structured/planned coding at work all day), as well as appropriate to exploratory/experimental stuff. Anyway, I'd be interested in discussing anything you've already done in this area, or any thoughts you have on how it can/should be approached... Thanks...

: In MiNT-Net is it possible to have a completion domain like NOS?

: I'd like to just type post, news, ftp, etc. And get post.dungeon.com,
: news.dungeon.com, etc.
: Anyone please?

No problem at all.
Just plug them in as aliases in your hosts file eg:

xxx.yyy.zzz.aaa post.dungeon.com post
qqq.ppp.rrr.sss news.dungeon.com news
etc

But, and its a big but, all the software that you want to do this
must be linked with the latest version of socket lib, otherwise your
progs will try your nameservers before consulting your hosts file.
The latest socket lib tries hosts first before looking elsewhere.
All AFAIK and IMHO, but it sure works for me.

regards.

3065. ERGO!pro for GFABASIC: English version?

Date: 1995-08-30 00:00:00 UTC
From: cb170@city.ac.uk
Message-ID: <422ppr$3nm@bambam.soi.city.ac.uk>
Source record: 159859

Hi all,

Does anyone know if an English version of ERGO!pro is going to be (or has been) released in the UK?

I had heard that an English version was coming, but I never heard anything else about it.

I have a German demo of it, and it's really good, but my German's not so hot, and I wanna buy the full version.

Thanks,

> FPATCH2 and the 28.8.

Yes, FPATCH2 has nothing to do with flow control. It fixes a bug in the way
the serial port is mapped.

3068. Hspeed modem help?

Newsgroup: comp.sys.atari.st
Date: 1995-08-30 00:00:00 UTC
From: 3ws5@qlink.queensu.ca
Message-ID: <422la1$ml7@knot.queensu.ca>
Source record: 159862

I just bought a zx288 v.34 zoltrix modem. I am having a few problems with it. It seems that it can hook up to a host fine, (it says connected at 115200 bps, I don't know what that means in baud.) however, if the line is busy, the modem starts beeping consistently in a low pitched annoying rhythm. The oh signal remains on. I cannot hang-up from stalker and I cannot get a response such as busy, or anything else. Thus redialing does not work. The only thing that works is to shut the modem off and then turn it back on. Then try and redial and hope it is not busy. I have two programs drvin and scc. I know that they are serial patches, but I don't have any other info on them. I also have serpatch 2.0 installed. I was running a serial mouse driver, which I have disconnected but have not found out the effect of it yet. Thus, I don't know if I have a hardware problem (tt or zoltrix modem) or a software problem in which I have to configure or optimize the system. Also I have no idea of the top speed or baud rate on a tt and how it relates to bps. Does connecting at 115200 bps mean a buad rate connection of 28800? I was wondering if anyone out there can recognize some of these systems. The modem checks out at least partly o.k in that I'm using it right now at 115200 bps (whatever speed that is) and in that it responds no problem to at commands on a terminal program. I would greatly appreciate some help on this very frustating matter. Oh and I forgot, I run stalker 3.0 and have my modem connected to serial 2. Should I use modem port 2? Or what port should I hook it too? Help?

Thanx
Waheed.

>I have HSModem installed but do I need the SerialFix program ?

MagiC AFAIK has no serial bugs so a patch prog is not necessary.
However, HSMODEM _may_ improve your transfer speeds (it makes no difference for me) and is necessary if you install the RSVE (and SCC?) upgrades.

Page Stream will do this as well...
PS is very Post Script Friendly...
It'll do Type II Post Script at any size (paper format) with really professional crop marks and everything. Will also let you save it as mirrored, negative, and much much more.
One drawback is that the company that makes Page Stream still sells it, but has pretty much drop continuting support and upgrades for it (except for a few printer drivers from time to time), but it is a good solid program in which any future development would mostly be speed ups...it's pretty complete and bugless however.

3078. PC keyboard connected to STE!!

Newsgroup: comp.sys.atari.st
Date: 1995-08-30 00:00:00 UTC
From: marshall@wayne.ircam.fr
Message-ID: <1995Aug30.081413.22057@ircam.fr>
Source record: 159913

Hi all,

I am currently in the process of re-housing my STE into a pc desktop case and am looking for a way to connect a pc keyboard to my ST. I know that there have been a couple of hardware devices to do this but is their a way to do this in software (like the serial port mouse program)?

Another solution is if anyone has just the keyboard case from a Mega ST/STE that they would be willing to part with.

Any help greatly appreciated

Jonathan

: Thanks everyone for the suggestions, I have followed all good advice
: (STalker set to TT/MSTe Modem 2 Port. 38400 baud. RTS/CTS. DRVIN and
: SCC installed in order and set according to previous posted settings. Not
: even running CPX, so that should not be the problem. Yes, even running
: FPATCH2. No other autoboots or cp's running.)
:
: Unfortunately, the modem is still not working properly. What's strange is
: that this same modem works fine on a mac 8100/80. I forgot to mention
: that when using the 28.8 on the falcon, I can connect with remote modems
: at 300, 1200, 2400, and 9600 baud rates without any noticeable problems.
: Removing the 28.8 modem and replacing it with the a Sportster 14.4 (and
: without changing any system settings) I can connect at 14.4 with no
: problems.
:
: Perhaps what I really need is to see an example of Claes' actual modem
: configuration. Claes, would it be possible to capture an ATI4 command
: from ya'?
:
: Thanks again everyone for your much needed help!

: Kula

I am not familiar with STalker, but I use my own program for
telecommunicating (I wrote it myself as I hate the others). I currently
have HSMODEM6 set to replace the lower rates with 115200, 76800, 57600, and
38400 rates. I use the 115200 rate with my 28.8 modem and I get
absolutely no problems. The "slot" that HSMODEM replaces for the 115200
rates is the former 150 rate.

So, in laymen's terms my setup would be:

HSMODEM
RTS/CTS hardware handshaking
150 bps (remember HSMODEM replaces it with 115200)

With text files I get an approximate transfer rate of 9500 cps when
logged on at 28.8, V.42, LAPM.

I get ZERO errors.

Rich

Hi there!

|>Well I use a Falcon/Hayes Accura 28.8 but I did have a few problems. I use
|>HSMODEM06. The two progs you need in your AUTO folder are DRIVIN (the serial
|>driver loader) and SCC (the program for the SCC chip!). You then should set

Note the order: run DRIVIN before SCC!!! (of course, physical order on your HD
is relevant).

|>I also have FPACTH2 to fix the bcomap bug. Hope this helps..

When using HSMODEM you don't need any of the FPATCHES! HSMODEM does all that
patching for you.

Under MonST use the S option. Your table should read:

TOS Start End
< 1.6 $FC0000 $FEFFFF
>= 1.6 $E00000 $E3FFFF

Also note I don't think STonX has ever been tested with anything but
TOS 2.06.

3084. Atari on the Net

Newsgroup: comp.sys.atari.st
Date: 1995-08-30 00:00:00 UTC
From: doctord@cent.com
Message-ID: <4227oq$2bi@esol.intermedia.com>
Source record: 159919

I have a question for my son-in-law.

He is running my old Atari 520 ST w/ 2.5 megs of Ram and tos 1.06.
He wants to get on the net and I told him that he should be running at least a 14,400 modem.

My question is: Can he run that modem on his present equipment and does he need to run it through
a high speed serial port?
Also what software should he be running if he can run this setup.

Please email me at doctord@cent.com as I don't get to this newsgroup very often.

Thank you

Bob

3085. Re: MultiGEM

MultiGEM is an old, old attempt at multitasking. Geneva, MagiC and (even)
MultiTOS are worth looking into. Don't waste your time with MutliGEM.

In article <41t6un$t61@columbia.acc.brad.ac.uk>, P.A.Booth@bradford.ac.uk (Paul Booth) writes:

>If you want to upgrade the TOS in your machines you can consider 3 main >rom options, 1.4, 2.06 or Magix blown onto eproms.

Hardly. MagiC doesn't need to be put into eproms at all. It's a software driver that replaces TOS at bootup.

Hi there,

a friend of my owns a Canon BJC4000 colorprinter. Unfortunately he hasn't any
driver for it. He desperately search a driver for Calamus SL.
Can somebody tell me if there exist a Calamus driver, commercial or shareware,
for this type of printer?

3089. HELP! St-Guide

Newsgroup: comp.sys.atari.st
Date: 1995-08-30 00:00:00 UTC
From: ade@adesamm.demon.co.uk
Message-ID: <809778526_OASIS_@adesamm.demon.co.uk>
Source record: 159924

Hello,
Can some please help me here, I've just re-installed ST-Guide on my hardrive,
(just re-partitioned it as it partitions were annoying!).
When trying to run ST-Guide it will suddenly lock up, sometimes straight away,
other times it lets me select a link then locks up!
Any one able to help?
The Guides and files for it are kept on partition G but all the paths in the
inf have been set to G !
I've had it working before, and it's not conflicting with any software, at the
moment the system has only got, GDOS and the Auto Clock in the auto folder and
no other accs, I'm also running Terradesk, but I've had all this running before!

Thanx for any help.
Ade.

It is fairly easy to setup - I managed it :-) It does have some problems, and
there are certainly many improvevements which could be made in the
user-friendliness dept.
My list of these is on its way to the authors!

3094. POV and CYBERstuff?

Newsgroup: comp.sys.atari.st
Date: 1995-08-30 00:00:00 UTC
From: robert@informix.com
Message-ID: <422637$l8v@news.informix.com>
Source record: 159929

For folks who have used the CYBER series of 3D CAD/Animation
software...

I have Persistance of Vision, both at home and at work, and I'd
like to import some of the objects I've made with CYBERSCULPT into POV.
POV can't import this stuff directly, but can as a RAW file...which would
be an ascii listing of all the triangles that make up the object, described
by listing each vertex of each triangle.

Now, I've looked through the CYBERSCULPT and CAD-3D manuals, and
I can't find a way to just output this kind of information...but I know I
did, once, by accident. I did something, I don't know what, that caused
this info to go to the printer. There are PRINT options, but it appears
to me that these print line drawings, not the data I'm looking for...so,
does anyone know how to do what I did?

Also, that's still not a complete solution to my problem, because
I would need to redirect the output from the printer into a file. Dredging
my memory provides the info that there are programs that make this possible
(something like "barrel"?) but I can't remember exactly what or where
(this is one of those things I never imagined I'd need, so I didn't pay a
lot of attention to it).

The whole process, given what I know, would be to design the
object, "Print" it, redirect the printfile to a file, massage the output
via a C program I'd have to write myself so that it was in the right
format, add surface normal info (or use a PD program I found for DOS that
will do that) and finally add it into the POV program. Am I making this
harder than it has to be?

Any info appreciated.

>files are damaged. Due to a hard disk crash, I lost the NVDI.INF file
>in which this change had already been made. It seems that NVDI should
>be prevented from making some check. Can somebody help?

Sure, Roland, I can help. (You're referring to 3.02, not 2.03 -- looks
like a type there, yes?)

Put CHECK_FONTS = 0 at the bottom of the NVDI.INF file. (Dang it, it might
be spelled CHECKFONTS = 0, though; try them both.)

That turns off the font ID checking. NOTE: When NVDI saves its cache
settings, it does NOT keep that line! You'll have to stick it in again.

I've had to put that line in my INF file. NVDI 3.01 worked just fine with
all my TT fonts, and 3.02 choked on them until I turned off the ID check.

RAM doublers are usually taken to mean software programs that compress RAM
and move unused apps from RAM to VMM (hard disk).

I know about the Marpet upgrade. That's just RAM.

No, William. MagiC's TOS is totally rewritten. And the impetus for MagiC
in the first place was to clean up the @#$% serial routines.

HSMODEM will do nothing. Serial Fix won't even know what to do.

>Software emulator when you run it on a Falcon, What kind of RAM it >requires,
>if anyone has run Windows (yes I am sorry for asking) and what it is good >for.

I don't know if it runs on a Falcon, sorry. I won't run Windows 3.xx or Win 95. It will run GeoWorks, slowly.

The main purpose of SoftPC is to let you run PC stuff that you can't live without -- DOS programs, not Win stuff, obviously. I don't have any PC stuff I can't live without, even though I own and use PCs (and teach others how to use them), so SoftPC is just a pleasant curiosity. I got MS-DOS 6.20 to load fine, and even DoubleSpaced my "drives" under SoftPC (they are not physical partitions or even virtual partitions, but rather are huge files that are seen by DOS as drives).

On my 48MHz TT, I got the same speed I get on an old PC.

3106. VME Bus Question

Newsgroup: comp.sys.atari.st
Date: 1995-08-30 00:00:00 UTC
From: mparrott@olympic.net
Message-ID: <421kat$oiq@oly.olympic.net>
Source record: 159941

I've noticed that my TT030 has a VME bus, and I know this can be used for adding video cards in this particular system. But I've also started noting more and more types of systems in the navigation and communications fields with 'VME bus architecture', supposedly to allow more flexibility in configuration and upgrading of certain components.

My question is, what does VME stand for, and is there any place to get one's hands on specs for that type of bus? I've been asking around where I work for weeks now, and no one seems to know.

Thanks for any info,

The RAM doubler being talked about here is a software patch to provide
Virtual Memory. Its not possible with the 68000 chip, though proper Virtual
Memory is possible with a 68030.

> weren't sure about MSTe compatibility) to a total of 12MB. The card

There was apparently a seperate MSTE version - but I only ever met one
person with one in his MSTE. Nobody could tell me why the plain STE version
wouldn't work - and it was much cheaper. I sold my MSTE and bought a TT
instead.

:-)

1 Technical Info

My email address will change more than once nexttime. Due to this reason I have an alias, pointing to my actual location - and if it's in the MAUS-Net: G.Castan@physik.uni-stuttgart.de

For easy location of this document at servers and mailboxes, I ask for using the following name(s) and saving the ascii AND TeX versions:
FILENAME = gdosi27 (German version)
FILENAME = gdosi27e (English version)
CR+LF should be used when saving at UNIX-Fileservers too, not just LF.

2 Introduction

I'm writing a program that prints out using GDOS. However, I have a problem because there is often no documention included with printer drivers.

There can also be different drivers with the same filename. What are the differences?

Here I have briefly (Stef: *briefly*?? Well, that's not *that* right anymore <g>) collected my experiences with printer drivers.

This collection doesn't generally explain to coders how to use printer drivers (except to problems not mentioned in literature). And you wont find information about the concept or how to install printer drivers. To get this refer to the list at the end of this FAQ.

What I want to describe here is more information about the several drivers:

o Where are the drivers available?
o How to distinguish them?
o What are the problem with them?
o Which drivers can be used for certain printers?

If anybody has more experience or questions, please write me. I will face the work to update this FAQ.

3 Motivation

With GDOS it took me ~2 hours of coding, to get the screen-output to the printer at maximum quality. And with (almost) no extra work I get output to printers I even don't know.

If anybody wants to write a program with printing options, they can use GDOS and take better care over the main program.

Nobody wants to pay for printer drivers if there's another program that didn't take the coder extra work with such stuff making this program less expensive (and surely better).

The user has - besides the lower price - another advantage. If he uses several programs he need place for the driver and the fonts only one time on the disc.

SpeedoGDOS is available from Atari shops (Atari Competence Center in Germany) now.

The (qualified) feedback to my FAQ has - compared to autumn '92 - raised remarkable. Due to Speedo the interest in GDOS coming from the coders seems to be bigger.

4 Changes

Since V2.4 I switched back to listing the changes here, not in the table of contents ...
Anyway, a "*" stand for changed chapter and "+/-" for new or removed chapter (I guess you'll know which char stands for what <g>)

+ 5.4 Port of an ISO-Modula-2 Compiler
* 10.7.4 & 19.1 got a reference to each other
+ 12 Signum!4
* 14
+ 14.1
* 16.3.5
* 16.4
* 18.4

* 19.3

One Important thing to note: The dates of the GDOS drivers are in German format, that is: DD.MM.YY! Remember that! (But I guess you alreade noticed that?)

5 Notes to the reader

Notes about problems right in this text weren't as effective as I wanted them to be. So, here are they in one chapter:

5.1 Programs

I only have few of the listed utilities. And I guess I'll never get to know each program put in a BBS or being updated. So you coders out there,

Send me information about your product

It's useful for you and users of your program too: Programs listed in this FAQ may be used by more people and the possibility of further development is higher.

5.2 Printers

A complete list in chapter 11 surely is very useful when looking for the right printer driver (e.g. for exotic printers). But I only got 2 useful mails yet. The way this list actually is, it's quite useless. Will I get more information or do I have to remove this list?

5.3 Bitmap fonts

Recently I got a very detailed description of the GDOS bitmap font format. But this would only be useful for the coders of font editors and converters (an I guess there aren't more than three or so), so I didn't include it here. If YOU think it would be useful here, convince me.
(Stef: and me for translating that <g>)

5.4 ISO-Modula-2

Someone asked me to include this note:

Wanted: Port of an ISO-Modula Compiler (100% - with Oberon extension) of an English producer (ported to UNIX, Mac, Windows, Amiga yet).

Profile: Computer scientist with interest in compilers (and creation)
ANSI-C experiences required due to the source code being written in ANSI-C.
Knowledge of English (for e-mail and docs)
Internet access (foer e-mail and ftp)

The port possibly will be without commercial background (but NDA). The port should be as shareware for the ATARIans

Contact: Gerd Castan (G.Castan@physik.uni-stuttgart.de)

6 VDI drivers

In these tables I have listed distributor, errors and useable fonts.

Drivers for NVDI 3 are listed in 6.8.3 seperately.

6.1 Ink printers with 150, 300 ... dpi

Name	Date	Length	Distributor	Errors	Others	Fonts
HP_LJET	22.02.89	45512	BELA		n.p.	LS
HP_LASER	25.09.89	36928	Atari,I			LS

PAINTJET:
80X180: 2-8 colo(u)rs
90x90: 16 colo(u)rs

MT90 is made by Patrick Dubbrow.

Using ink drivers produces a problem with bitmap fonts. Using 300dpi all is ok. But 360dpi fonts are optimised for best efforts with pin printers having thick pins. Using ink printers makes the fonts look much too thin.

Solution: either use 300 [600, 1200 :-)] or exclusively use vector fonts

6.3 9pin drivers

_SLM_HS____	17.01.94_	_63663_	_ROM_____	___	_n_	_____	LS,_SPD_____

SLM_HS is a SLM driver for the Falcon (when using the Heatseeker interface)

6.7 Screen drivers

The screen is (if VDI functions are used) seen as an output device just like printer, plotter etc. That's why fonts for the screen can be installed in ASSIGN.SYS just like for printers.

Normally this isn't noticed because the drivers are in ROM. But they can be used like printer drivers.

Note: For system fonts only (like the original ones) non proportional fonts with a 8*8 or 8*16 matrix can be used. That's limited by the AES not VDI.

With newer AES (from 4.0?) it's no problem to use fonts of free choice (Variable AE_FONTID and AE_FONTSIZE in GEM.CNF, see [Sche93]). Coders should make sure their programs can take that. (even like scrollbars of free width)

Bitmap fonts not assigned for screen driver 1 are not available for other screen drivers.

6.7.1 LineA

The so-called LineA routines are subprograms of the screen drivers from the ST series, to bee seen undocumented. This is the hardware depending part of these drivers.

The attentive readers will notice this: Exchanging the drivers removes the LineA routines as well. As happened on the TT, for example.

So never use them!

You can still /read/ from the LineA variables, but why bother?

6.7.2 Setscreen & Getscreen

These XBIOS-Functions (mostly Setscreen) should'nt be used.

But what am I talking. For those useing them or those being tortured
because someone did it:

The video hardware of 1040STE and Mega STE has an hardware bug. When defining
a new physbase with Setscreen (and if it's the same gotten with Getscreen),
it may happen that the screen is 'folded'. This happens due to the movement
of a register at a special moment, which is only allowed to be moved at
special phases of the screen output.

What has to be done?

Users: The programs NVDI and FALT_OFF stop this error. Or give this FAQ to
coder.

Coders: Either even don't use Setscreen.
If You use it though: If physbase isn't changed, the value taken
with Getscreen may not be used. Use the
value -1 than physbase!

6.7.3 NVDI and WARP 9

There are two often used programs exchanging the ROM drivers: NVDI and WARP
9 (earlier QuickST). TurboST was distributed by BELA but isn't updated no
more.

If these are used once, one will never want to miss them: the Desktop seems
to be terribly slow. I will never want to work without NVDI on my Atari.
Others say the same about WARP 9.

NVDI uses strongly optimised drivers for the ST and TT resolutions. Sadly I
don't know which drivers are used by WARP 9.

NVDI is available from Behne & Behne and contains not only the drivers but a
GDOS and a manual describing exactly all VDI calls.

WARP 9 is available from CodeHead.

Due to this NVDI is spread in Germany and WARP 9 in the US

Unlike NVDI, WARP 9 only speeds up the text output and graphics stay
as slow as before. AND the newest version doesn't work with MultiTOS. It
Works on the Falcon too, but I don't know if it supports *all*
resolutions there. (Like with Screenblaster, BlowUp030 or others)
15 bit and 16 bit screen modes aren't supported by it.

```

IMG-0300 can be copied (non commercial). The other IMG-0??? drivers are by SciLab. ZEBRA is for the Zebra Labelprinter.

6.8.1 Memory drivers

A memory driver doesn't do anything else than a screen driver (see [Pru93b/c]). But the output doesn't get to the screen driver, but in another memory to be influenced there.

The usual v_openwk binding doesn't have all parameters needed to open this driver. If not included to the language this binding must be made by yourself. A listing is found at [Pru93c].

The memory driver listed above is only capable of b/w output only and has a logical resolution of 300dpi. The (matrix) drivers tested by me have no problems with fonts installed that are for other other drivers. The memory driver should take screen fonts - due to the 300dpi.

Problem could appear because of the aspect ratio (relation of pixel width to height) - normally not similar to the screen resolution.
Due to this circles can be displayed as ellipses.

With NVDI 2.5 or higher, you can output to offscreen (colour)bitmaps. These work with all VDI calls, and you can copy the resulting bitmap to the screen window.

6.8.2 Plotter drivers

A HPGL driver seems to be distributed with the program DATA. On PD disk ST 458 (German PD series) is one too. If I get more about it I'll include this info here.

6.8.3 NVDI 3 drivers

NVDI 3 has its own driver concept. Only a small quantity of drivers is included, but they're very fast, small and flexible.

The drivers are:

```
_____________________________
|_Treiber______|_Datum____|
| PINPRN.SYS | 19.10.94 |
```

PAGEPRN.SYS	19.10.94
IMG.SYS	30.10.94
MEMORY.SYS	18.10.94
META.SYS	18.10.94
_ATARILS.SYS__	_18.10.94_

Depending to the colo(u)r printing capability of a printer (this can be set in the MAKEPRN.APP), the drivers have to use different offscreen drivers to create the graphics (this can't be found in the manual coming with NVDI 3
[Stef: A manual like for NVDI 2.x is in work]
Gerd: It will be an ascii file for FTP servers and BBS, not a printed one)

The Offscreen drivers are:

_____
_Treiber_____	_Datum____	Farben__
OFF002.NOD	06.11.94	2
OFF004IP.NOD	06.11.94	4
OFF016IP.NOD	06.11.94	16
OFF256IP.NOD	06.11.94	256
_OFF32KFL.NOD__	_06.11.94_	_32768__

The actual NVDI 3.01 can't handle colo(u)r printing though :-(
3.02 will. (Which is soon to be released. More then ...)

The flexibility to create a driver's INF for printers is great. To code a driver for SpeedoGDOS you have to become a developer for SpeedoGDOS.
It isn't that easy ...
With NVDI you only have to enter you printer's codes in MAKEPRN.APP. So you only have to check you printer's manual, not learn or do C coding.

The codes driving the printer are saved in the INF files belonging to each driver. A flaw is that these assignments aren't simply exchangeable.
There's no documentation about the file format and no program to extract or add codes yet. The only way is to exchange the complete INF file.

Another problem not even noted in the manual occurs when assigning pixel fonts in the ASSIGN.SYS. Guess that you have assigned 180dpi fonts to the PINPRN.SYS. It's easy to change the output resolution to 360dpi by the CPX.
Then the printout will be catastrofugly.

A workaround is to duplicate the driver with another name (close to the first ...) and assign this one to in the ASSIGN.SYS too, but with different fonts.

At last I think those drivers conceptionally are much better compared to the ones coming with SpeedoGDOS 5. No colour printing yet, though.

6.9 What's missing

I don't know drivers using the abilities of the following printers:

o Canon BJC 600 - A colour printer with 4 heads (CMYK) 64 nozzles each.
In the colour mode he's compatible to:

- Canon BJC 800
- Epson LQ 2550/2500
It's resolution is 360x360. I dont's know any GDOS driver supporting the BJC's capabilities directly (or via compatibility mode) when using colours.

7 Errors

Errors in the printers drivers - that I know - are the following:

1 These drivers display Fonts with the attribute 'light'
2 Doesn't work on TT
3 The EXTENDED ENQUIRE FUNCTION (VDI 102, vq_extnd) doesn't give back the parameters as listed in the German 'Profibuch' (Jankowski, Rabich, Reschke - Sybex)
4 Using the attributes 'italic' and 'outlined' the letters of bitmap fonts are cut off on the right side. This error appears independent from other attributes being used.
This error was in the Libraries of the driver sources from Atari and seems to be included in all drivers except to NVDI and SpeedoGDOS.

If theres nothing written about an error I don't know if this error appears or not.

Seems it's no accident, that Xact only uses the attributes 'fat', 'italic' and 'underlined'. (See [Res92]

Another reason against using 'outlined' is the following:
If You make a driver calculate an outlined font from a normal one it get's 'wider' by two pixels. Due to the reason that a pixel has a width depending to the resolution (other than a fitted font) a text gets different widthes in each resolution. But who wants to have different textformat on different printers? The only way to stop this is letterspacing - typographic 'bullshit'.

8 Fonts

8.1 The meaning of ''Font`` and ''Face``

First: What's the difference between a fonts and a face?

When calling a font selector there may be Dutch 801, Dutch 801 italic, Durch 801 Bold and Dutch 801 Bold Italic. These are 4 faces, alltogether creating a font.

This separation isn't that simple at bitmap fonts, because all attributes are created from only one file (this can be made with vector fonts too, but it's quite nonsens In my opinion). That's why I first didn't note that this attribute creation is buggy in some versions of SpeedoGDOS (see 16.3.3).

Using vector fonts this border isn't that sharp with Multiple Master fonts (see 10.4.1) and TrueType GX fonts (see 10.5.2) too.

Me I'm not always using this separation of font and face in this FAQ.
Especially in the chapter about font formats. ("Face format" doesn't exist
and it'd sound strange if one says:
''These faces are saved in each font format.``)

8.2 The meaning of ''format`` and ''representation``

''Format`` is used in two ways when talking about fonts, what makes it a
bit confusing.

First it's used e.g. for the TrueType and the Type 1 *format* and second
it's used to differ the Macontosh and the Windows *format* (and others)

To solve this confusion in this FAQ

o We'll use ''format`` to seperate TrueType, Type 1, Speedo ...
o ''Representation`` will be used to seperate the file formats.
This is used for mathematics and physics when groups *look*
different but both can be displayed bijectively upon each
other - even in their structure
(Stef: harggngrl. Sorry, I hope Gerd or Chris will help here.
Chris thought of using ''version`` instead)

Then there's no more confusion about this:
- Macintosh TrueType format in Macintosh representation
- Macintosh TrueType format in Windows representation
- TrueType for Windows format in Macintosh representation
- TrueType for Windows format in Windows representation

(Stef: looks funny <g>)

And it's easier to say that Speedo (from 5.0) and NVDI (from 3.0) need to
use the Windows representation of a font, but don't care if the fonts are
in Windows or Macintosh format.

9 Bitmap fonts

The fonts used are bitmap fonts in the DR standard format. They have to be
saved in Intel format. Motorola format isn't supported by any GDOS.
(See [Whe88] and appendix)

GDOS bitmap fonts have their width information defined in both, screen font
and printer fonts. Sadly the designers were a bit too zealous and fitted the
width of the sreen fonts to make them look very beautiful. They've done a
good job, but they're not similar to the printer fonts and don't allow
WYSIWYG.

There are many fonts on the Internet only for the screen and maybe useable
for one printer. Everybody using these fonts should know that he can't print
documents in an acceptable quality via GDOS.

But in the Atari and former BELA package there are included fonts for
all printer drivers in this package (the 360*360dpi fonts are missing in the
Atari package). If you have a useable program you can print every document
with every driver.

10 Vector fonts

Vector fonts don't use pixels, they are created with algorithms - supported by shapes and hints. These algorithms (see METAFONT for a good example) make the fonts copyrighted like normal programs. (See [Walsh] for this)

Here I'll write a bit about vector formats. Why should a pure user try to understand it? Nowaydays you'll just get a cheap Font CD, choose 17 of the most interesting fonts for your first poster an print out the creation.

Problems are: I have one face in different formats. Which one should I take? Sometimes I have problems on screen, when I print out something or only when using a specific size. So what?

(When you have 17 Garamond styles from 17 different distributors it's better to read a magazine about typography or DTP to get help)

10.1 FSMGDOS fonts

The vector fonts with the old FSM-GDOS format by QMS/Imagen Corp. are named with OTL.

These fonts and drivers should'nt be used no more and are listed to only for completion of this FAQ.

10.2 Bitstream Fontware fonts

Just to prevent confusion:
Bitstream uses the Fontware format. This - for example - can't handle hints.

It's got nothing to do with the GDOS font formats listed here.

10.3 Bitstream Speedo fonts

The vector fonts in SpeedoGDOS format are named with SPD.

They are supported by all SpeedoGDOS releases and by NVDI 3.0 or higher.

10.4 Type 1 fonts

Type 1 fonts are available for MacIntosh abd MS-DOS/Windows. They only have differences in the internal representation, not in the information.

At least one of these formats is supported by SpeedoGDOS from V5.0a. But I already found some that SpeedoGDOS 5.0a can't display.

Just a note:
It's wrong thinking PS interpreters could use Type 1 fonts just because Adobe's original PS interpreter does this.
It depends on the producer of the interpreter to decide, which font's format is used. But one thing you can trust:
A PS document looks different on screen and printer (Stef: hehehe, Calamus)

7.3.5 Multiple Master (MM) fonts

ATM 3.01 (Adobe Type Manager) for Windows now is capable of scaling MM fonts. With this technology not only height, size, skew angle and rotation can be set for output, there's one more continuosly parameter. This is to set, what thick a face is to be displayed. This is no simple algorithm - like others at GDOS - but the font designer can make sure where to change a face when it's more or less fat.

This subsection only is FYI. SpeedoGDOS 5.0 only can handle normal Type 1 fonts - and NVDI none.

When taking a look at [Hil95] (about the URW PrintWorks CD), it's visible that
URW has such technology - internally - too. The extremely interesting book [Kar92a] is by URW too.

Q: These MM fonts are an extension to Type 1 fonts, right?

A: Yeah!

Q: So I can use MM fonts with Windows, but what do I do with my old PostScript printer?

A: No matter, he can handle it anyway.

Q: Huh? Which way?

A: It's been noted already that vector fonts are algorithms. Adobe simply defined a new operator.

Q: My old PostScript printer doesn't understand that operator, right?

A: Right. But the definition of this operator can be distributed within the font. That's the way it's actually done.

Q: That's why all PS printers can handle this?

A: Sure. Only the coding interface should have to be fixed. That's why a new ATM is released for Windows.

Q: Great! Then I won't have to get 50 faces for each font.

A: Yeah, and you'll have enough money left for an ice ;-)=

10.4.2 Type 1 GX fonts

These are told to have the same features as TrueType GX fonts (see 10.5.2).

10.5 TrueType fonts

This format is available for MacIntosh and MS-DOS/Windows too.

SpeedoGDOS from V5.0a and NVDI from version 3.0 can handle both, no matter if it's for MacIntosh or MS-DOS/Windows. The MS-DOS format

is a superset of the MacIntosh format.

By Apple's definition it's got different tables (like the chunks known from the IFF format). In the table's header a name and a length is noted. This way a program can ignore tables it can't handle. When new types of tables are defined, they have to be announced to Apple. Required and optional Tables are defined by Apple too.

On Macs, .suit is the suffix for TrueType files. The data is found in the resource fork.
(Stef: That's not always right, with System 7 fonts are in the folder Fonts in the System folder. They may be in a suitcase there)

I don't know any official documentation which tables are used or required by SpeedoGDOS 5.0 ff or NVDI 3.0 ff.

10.5.1 TrueType for Windows 3.0

Microsoft used this procedure to announce new tables and make them mandatory for Windows.

The difference between the Apple and Microsoft format simply is that Microsoft declared more tables as mandatory. Plus the fixed order of glyphs when special flags are set. A definition of the Microsoft format is found in [Mic]

10.5.2 TrueType GX fonts (or TrueType 2.0)

Apple expanded the TrueType format for any design axle. So we have a technology similar to Multiple Master fonts (see 10.4.1).

New Features:

o TT GX fonts may contain Type 1 data
o automatic ligature substitution
o more than one base line (e.g. for mathematic formula)
o track kerning informations (NVDI from 3.02 uses them)

These features are distributed by the Line Layout Manager (LLM) on the Mac an they are independent from the scaler used. So - at least on a Mac - these features can be used by all font technologies

Informations are available by the Apple developer support organization (APDA).
Their EMail address is: adpa@applelink.apple.com
The ''TrueType Book`` describing TrueType 1.0 and the ''QuickDraw GX Font Formats Book`` (describing the GX extensions) can be ordered there.

TrueType 2.0 has new tables requiring (different to MM fonts) new scalers to use this technology.

10.5.3 TrueType for Windows NT

Instead of using the GX font's definition Microsoft defined another new font's format for Windows NT (Stef: When are they about to define

darkness as a standard <g>) A special feature is the double amount of required characters compared to TrueType 1.0

10.6 Calamus fonts

Can YOU tell me more about these?

10.7 Comparison of vector formats

There's no noncommercial program on any platform that can convert one format to the other. A lot of fonts are only available in one format.

But what makes a conversion so difficult? To ask different: Which informations are stored by which way?

10.7.1 Curves

First the shape of the chars should be saved. But that for many ways are used (see [Kar92a]):
Type 1: Uses cubic Bezier curves aka cubic B-splines
TrueType: Uses square Bezier curves aka square B-splines
Speedo: Uses cubic Bezier curves aka cubic B-splines

For most applications there should be no difference between several font formats. Therefore SpeedoGDOS transforms TrueType characters into cubic bezier curves for v_getoutline. I'd like to get (optional) quadratic bezier curves in this case and v_bez_fill should be able to cope with it.

Square B-splines are much faster than cubic Bezier curves but you have to store about 4 times as much points to achieve the same quality.

10.7.2 Hints, instructions, switches

The next problem is the display on media with low resolution. For a neutral observer Speedo fonts always look quite good on the screen (well, some fonts are ugly by nature).

But I've found TrueType fonts that look as ugly as nothing else on the screen. For example the two vertical lines of an 'n' are not the same, one is 1 pixel and the other is 2 pixels thick.

The way to prevent those errors are hints. Companies use different names for Hints.

o Adobe: Hints
o Apple: Instructions
o URW: Switches

This method is used by Speedo, Type 1 and TrueType (but not by Type 3 and CFN). But hints given by the format don't mean that they're used too! (That's why others got different experiences with these formats than me)

So, finally: All these three font types can look very good on the screen, Type 3 and CFN can't. [ever tried to print CFNs on a printer with less than 360x360dpi?]

Now I've noted, what hints are doing and in which formats they're used. But *how* do they work? Specific parts of a character have a specific >>job<<, like serif, bow etc. This is saved besides the font's outline. This way the scaler e.g. can create similar vertical lines of a >n<. More is found in [Kar92a]

Type 1 only can handle very few different hints compared to other formats. But the new MM technology (see 10.4.1) makes Type 1 much better at some parts.

Note:
with v_getoutline you get the outlines in the workstation's actual resolution. Remember that using hints depend of the resolution. Plans exist to make v_getoutline independent from the actual hint size.

10.7.3 Internal resolution

After the problem with low resolution now there's the problem with the high resolution. Even if you think there shouldn't be any; there are! (See [Kar92b] too)

To display a vector font first an internal system of coordinates has to be selected. To do this the em-square is devided in units. CFN has one from 0 to 16000, Type 1 (which was created when there were no high-res printers) one from 0 to thousand. Due to this there are 'corners' visible at large letters or high resolutions (in the professional league)

Referring to [Kar92a] the internal resolution can be raised by the DIV operator. But this has to be supported by the font editor.
(Is this done regularly and does the scaler get remarkably slower by this?

CFN can make the big deal here.

With TrueType, the font designer can choose a resolution up to 16768. Resolutions equal to 2^ are faster than others.

(Which internal resolutions do Speedo, TrueType and OTL have? Is the Bitstream format mentioned in [Kar92a] identical to the Speedo format?)

10.7.4 Linear and optical scaling

Do we now have - with the description of the shape, a high internal resolution and the hints - a scalable font? Sure not!

A font being designed for 16pt has a totally different shape as a doubled 8pt fonts (see Knuth: The METAFONT book; Kopka: LaTeX, [Kar92a] etc.). A well designed font isn't lineary scalable.

In large fonts vertical lines are much thicker than the empty space between them. But this information for optical scaling can be saved in a font too.

So a font, being 20 pixels high on the screen (this is usually a large font) should look different to one being 20 pixels high on a laser printer (this is a small font that should have small vertical lines).

The rest of this subsection was misunderstood by to many people. Anyway I seem to be the only one thinking here's a problem. That may have (at least) three causes:

o I can't make you understand what I think
o I'm a crazy mind
o the problem's too complicated to make anyone even *see* a problem here

Well, let me (Stef: and me) start anew:

Vector formats make it possible for the font designer to decide a face may look different in points or pixels below a specific size. For example it's useful to make a face broader when used with a small size [Kar92a] -independent from the printer's output quality.

So, let's display a small text in a window (e.g. with a size of 8pt). And the font designer made this face look broader at 8pt or smaller.

Another window is used as a magnifier to get a doubled size (Almost any Word processor has this function - Stef: really?)

This doubled view in the magnifier's window *should* be broader like the 8pt text, the WP's coder shouldn't have to take care about that.

But the coder has to use a size of 16pt in the magnifier's window - and now the designer's decision (to make the face look broader from 8pt) is ignored!

To solve this problem there are two ways:

1. The coder sets two values for the size.
- The linear size (16pt here)
- The optical size
But the font engine and the bindings have to be fixed to that.
(it's my recommendation, no reality)
2. The only method acutally possible to be done are the offscreen bitmaps handled by NVDI (when the EdDI cookie exists). When opening these workstations the logical pixel size has to be set. After that it can't be changed no more each optical scaled font size costs a lot of RAM. Especially for printing each (non standard-) optical scaled text has to be buffered as bitmap (either by the driver or the program itself; it depends on the GDOS release if the driver saves bitmaps). This bitmap can cost more than the user's (or his computer's) RAM.
3. Another (not yet existing) possibility would be a free choice of of linear an optical scaling by v_getbitmap.
4. The most simple way - there wouldn't be a buffer fo bitmaps needed - would be as follows:
the logical pixel size can all physical and logical workstations.
The scalers *can* handle different pixel sizes, so I think it wouldn't be difficulty to make NVDI and SpeedoGDOS handle this.

The problem with the magnifying window could be solved by using another virtual workstation with logical pixels half as big. Both windows could use the 8pt text then. Both windows would display this text as the font designer wanted it to look like - and the magnifying window would display the double size of the normal window.

If different optical scaling can be found in a document, the logical pixel size has to be changed afterwards - or the linear and optical scaling has to be set at the font size.

See 19.1

Did anyone get it? (Stef: Yeah, I'd like to get feedback too!)

10.8 Format conversion of scalable fonts

From what I wrote above I hope you'll realize that converting a font from one format to another is about as easy as converting a highly optimized program from one language to another ...

Problems:

o The only converting program I (Stefan) know for Atari
is TypetoType fby Hasso Baudis, converting Type1 to CFN
o There isn't any program on any platform that is accepted by the
comp.fonts community (according to the comp.fonts FAQ)
o For a program capable of converting fonts you'll pay a big
amount of money. But even good programs need manual corrections.
Looking for a PD or shareware program won't be
successfull ...

10 Printers

Producer	Printer	Drivers Fitting
NEC	P6+,P7+, NECP...	
	P60,P70	NB15_(FX...,NX1000)
HP	LaserJet_II	HP_LJET
HP	DeskJet,_LaserJet_III,IV	DESKJET_(HP_LJET)
CANON	BJ10E	BJ10
CANON	LBP_4/8	CANONLBP,_LBP
Mannesmann-Tally	MT_90	MT90
Epson	Stylus_800	STYLUS

Drivers in parantheses work but don't use the ability of the printer totally. This means - for 24pin printers - that these are used in 9pin mode. At HP compatible Laser and Ink printers this means that the data isn't packed though being supported by the printers.

Some Deskjet drivers are said to make problems. In this case try the Laserjet driver. The printing takes longer then (due to more data) but the problems should disappear.

The BJ10 drivers use the Proprinter emulation. Don't use them in the epson mode!

The Stylus shouldn't be used with 24needle drivers. The needles overlap (the ink dots of the stylus don't) and so the drivers just don't print some dots.

The meaning of compatible normally is made by the producers of the compatible printers.

Notes:

o If You don't find your printer in the list and knows a fitting driver, please write me a note.
o Try other drivers even if you have found one fitting to your printer.
o Of course the FontGDOS drivers have a lot of problems with the memory. But the speed of'em is faster than the other (except Speedo ones).

12 Programs

Nowadays it's obvious (but not usual) to use GDOS in every program.

The following list is limited to those using GDOS to print too.

```

```

This list is no commercial. I'll include every program I get to know.
(Comment by the Translator: Sorry for mentioning Atari Works three times,
but I wanted to keep the 'Text/DTP' and 'Spreadsheet' Chapters')

Notes:

o Programs listed in the Speedo column with 'y*' support Speedo but don't
use it - don't output text too.
o Xact can print Speedo fonts without Speedo too.
o FSM-GDOS is included in the Wordflair II package.
o Platon only uses GDOS to make output of metafiles
o I didn't make it to print via GDOS in OPUS.

(I've been told, OPUS doesn't chose the fonts it can handle with,
and doesn't print if even one of these fonts is installed. See 7.1 too)
o Programs only printing via device 21 (like OPUS and CLA are out! (see
16.2 too)
o 7up only uses non proportional fonts (e.g. Monospace 821 from Speedo)
o Tempus Word only supports Speedo Fonts but prints with its own drivers
This seems to be due to the capablity of handling CFN and its own fonts
o That's Write & 1st WordPlus 4 both can use Speedo fonts without
Speedo. TW 4 will be able to use TTF and Type 1 without SpeedoGDOS
(well, TW and the SpeedoGDOS 5.x font extension to TTF and Type 1
is created by the same coders ...)
o LDW-PowerCalc: MAXON lost the purchaser database. Ask COMPO for updates
(Stef: hmm, it seems to be a German-only problem?)
o Tarkus is a label printing program.
o In 16.1.2 you'll find a list of programs working *only* with ABC-GDOS.
o It seems that Signum!4 only works with NVDI 3.*, not with SpeedoGDOS 5.*

Kandinsky Version 1.73
ftp://ftp.cs.tu-berlin.de pub/atari/Graphic/kand173
(Version 2.01 is the actual one, though, note by Stefan;
Gerd: but not on any FTP-Server
Stef: Should anyone put it there?)

13 Utilities

13.1 fontfix

Problem: The font height is included wrong at some fonts. fontfix discovers
this error and corrights it.

In the Internet fontfix can be found here:

ftp://ftp.uni-muenster.de/pub/atari/Applications/Dtp/Fonts/Gdos
ftp://ftp.cs.tu-berlin.de /pub/atari/utils

13.2 Outline fonts

Outline Fonts Accessory by CJG

What for: This utility edits the EXTEND.SYS for SpeedoGDOS. This file
contains a description of the volume from the Speedo caches, the
fonts and the font-sizes. The caches can be saved to disc and loaded
again from there too.
A good done program except to the preset cache sizes fitted to
FSM-GDOS not Speedo.

Filename: OUTLINE.PRG alias OUTLINE.ACC, 67644 Bytes
Speedo 5 49254 Bytes

Spread with SpeedoGDOS.

(Why doesn't Atari make it to make programs including a display of the
version?
Chris: Because Atari aren't in the computer business any more :-(

)

13.3 Printer drivers

GDOS Devices Accessory by CJG

What for: To edit the ASSIGN.SYS

Filename: DRIVERS.PRG alias DRIVERS.ACC, 64878 Bytes
Speedo 5 41592 Bytes

Before starting this program it's better to create a backup of the
ASSIGN.SYS!
The (at least) two reasons are the following:

1. The informations about the bitmap fonts are removed without comment.
2. ASSIGN.SYS is removed by a new one if 'Benutzereigen'-'Hinzufuegen' (in
the German release) is selected wihtout any chance to get it back.
(The English Version should have a Dialog like 'Own drivers' 'Add' or
similar). To all coders: Don't copy that style!

If this utility should display no drivers sometimes simply start ASSIGN.PRG
(see next subsection)

DRIVERS.PRG/ACC only displays the Speedo drivers of my collection. Does
anybody know, how it does this? Even it doesn't display the Filename but a
name being included as string in the driver. How does one get there?

13.4 ASSIGN

ASSIGN 1.0d is by Dirk Sabiwalsky (PD).
(Supplied with NVDI3?)

It tests three things:

o Are there several fonts using the same ID and have different Names
(Typefaces)?
o Are there several fonts using the same ID and the same Pixelheight?
o Are there several fonts with the same name (Typeface) and different
IDs?

13.5 FONTCHK

FONTCHK tests GDOS fonts if they have possible errors.

For example, it's spread with ProList.

13.6 FONTCNV

Converts GDOS fonts from Motorola to Intel format.

Comes with ProList too.

13.7 GEMFont

Fonteditor being able to read Signum- and PK (TeX)- Fonts too.

Internet: ftp.tu-clausthal.de:pub/atari/systools/gdos/gemfo120.lzh

Use the chance to get a new unlzh or lhxarc.

13.8 FontMonger

Converter and editor for different vector formats. Only works on IBMs or
MAC though.
(Chris: Does *not* work with Speedo fonts. We have a copy at work and
I've tried!)

13.9 Font ID

Font-ID is a little freeware tool made by Frank Schneider. In a window it
displays the fonts installed with GDOS or SpeedoGDOS including the Font-ID
in different sizes. So you can get an overview when you don't have a program
with font selector/ID display function at the moment.

13.10 X4U

Speedo fonts have much more glyphs than the ones displayed in the ASCII
charset. With this program by Peter Hellinger you can setup, which char is
to be used at which ASCII code. It's distributed by R.O.M.

Now a little story about this program (MausNet readers may remember):
R.O.M. logicware planned to put this tool on the SpeedoGDOS 4.2 disc too.
That didn't work, Peter used his Magic library (see subsection 14.3)
making the program too large. So R.O.M. sold it seperately for DM 25.-
what made Peter (often called ''Helli``) force a lawsuit (Stef: correct
translation?). Ulli Ramps got tired of this argument and set X4U's status to
PD, making Helli call his lawyer again (Stef: *sigh*)
(Hold the line, to be continued next subsection)

13.11 Charmap

Charmap is Atari's original tool making the same as X4U, but only
developers got it.

But charmap is the name of Helli's newer-better-larger (Stef: that's my
note there) version of X4U, which is - at version number 0.9 - Freeware.
(To be continued)

13.12 GDOS-Font

Filename: GFONT112.LZH
Shareware with limitations
GDOS-Font 1.12 (Aug. 22nd 1994) by Holger Weets@ol.maus.de
(Remember: when sending mail to any @maus.de user, no mail bigger than
16KB!)
Display and editing of GDOS fonts, including or removing them in the
ASSIGN.SYS! = Never more manually changing the ASSING.SYS, GDOSFONT does it for
you!
(Stef: This is the - translation of - the original FILE_ID.DIZ. Just to
note this, if you think it's a commercial <g>)

13.13 REFONT

This Program converts Type-1 fonts between Mac- Unix- and Windows format and TrueType fonts between Mac- and Windows. But no conversion from TT to T! or vice
versa (Stef: :-/=)

13.14 Arkus

Arkus is a font manager by Pergamon Software

But I didn't quite get the point, what this program may be used for. Can you tell me?

14 Font Selectors

We all know this useful thing about file selectors:
The Operating system soesn't only offer a file selector, it's got an interface to use own file selectors in every application.

A scaled interface for FONT selectors doesn't exist, normally they're offering their jobs by cookies. The work to make a program support font selectors via cookies is much smaller than writing one for yourself. If there wouldn't ... but let's take a look at the candidates first.

According to font selectors there have been a lot of changes in the last months that are not yet in this FAQ. That's why the descriptions about most of the listed selectors are no more actual now and there are new ones, that aren't in this list too. (Like Calvino or the new FontSel)

14.1 the quick brown fox

I guess a lot of you out there (at least in non English speaking countries) sometimes get rid of the sentence ''the quick brown fox jumps over the lazy dog`` which is used to display the font selected. Why is this sentence always used? The answer is quite simple: In this short text you'll find all letters of the alphabet.

In a book of (IMO) Martin Gardner I discovered are a lot of such sentences (English and German). Sadly I don't know which of my 18 Gardner books contains these examples. Hints are very welcome.

14.2 UFSL

UFSL from Michael Thaenitz is freeware and is allowed to be distributed with any application. The last version is 0.97 from April 30th 1994.

Fonts (faces) and size can be selected comfartable. But I didn't get a face displayed after selecting a free size.

Attributs are missing and the dialoge is only modal.

UFSL sadly isn't in development no more. But for further development of an *unique* interface for font selectors, the sources are free!

14.3 XUFSL

XUFSL 1.05 by Stefan Rogel is the one with most features - compared to the other ones mentioned here. It even can handle Speedo 5 (and NVDI 3,

note by Stefan) too.

This selector looks great to me. The large amount of information is handled very well with index cards. The flaw I noted (Popups to select faces), doesn't disturb me as much as in release 1.03 (where the big amount of popups were quite irritating).

All interesting informations about the face selected are shown, the complete ASCII table can be requested.

My wishes would be:

- printing the ASCII table of the font selected
- access to the complete 16Bit charset

14.4 Magic (from Peter Hellinger, *not* MagiC!)

This selector is part of Magic 4.00 from Peter Hellinger and not available separately. Magic itself - NOT MagiC! the multitasking OS - can be copied freely. But the information how to use it must be paid.

It's nice that this selector can be set in a non modal dialog, FlyDial or normal dialog. Scrolling through the list is fast too.

Attributes aren't selectable and the size selection in the edit line isn't acceptable the way it's done.

The selector only can be used when the event handling is completely done by Magic, what makes the coder use a fixed code structure (working parts must be rewritten, other things don't work anymore) and produces new errors.

14.5 FontSel

FontSel from Holger Weets is totally cmpatible to UFSL for the programs. It's small size and the selecteable attributes are a very nice feature.

Version 1.00 from May, 11th 1994 only shows the System Font when using Speedo 5.0a.

14.6 Minimum requirements

A Font selector should work with all OS-releases (TOS, MiNT, MultiTOS, MagiC!, Geneva, MagiCMac, Janus, GEMulator Stef: uuh hard stuff for coders <g>). Plus with every video hardware supported by the VDI and should show each font available from every GDOS version. (Pixel fonts, Speedo fonts, Type1 and TrueType).

14.7 Characteristics liked to be seen

14.7.1 Attributes and selection

Its quite complicated to make the user set further characteristics of fonts in an extra dialog. So, at least the standard attributes (bold, outlined, ...) should be directly made available. Well, this could cause lotsa argues, but when using vector fonts, attributes are selected by using another face of the font (bold, italic ...) and not enabling this

for bitmap fonts would be very inconsistent (Stef: It's great to have a German<->English dictionary for computer related words <g>). If a program doesn't support them they should be made invisilbe (Stef: or - as the menu use - disabled).

Same with the skew angle.

Not every program can handle all fonts. According to this every program must be able to set, which faces have to be invisible or disabled.
An example:
Some programs (like 7up) only use non proportional fonts.
A further feature (but not exlusively, due to BASIC) it should be possible to pipe a procedure variable to the selector setting the kind of displaying for each face.

14.7.2 Windows and event handling

It would be nice if the program could set the selector in a window or normal dialog too. It can be done much easier and more flexible than in Magic.
The font selector opens a window in the calling program's name and gives back the window handle to it. The application further handles the events and if one is for the font selector's window it is passed to it via a procedure call. This simple mechanism enables the use of multiple (system wide) selectors, colour pickers (and more) distributed by different producers being in windows on the screen the same time.

Once more:
This parallel work only is possible when no selector uses its own evnt_multi loop.

Almost all utility coders want to make it the other way (and do so). So, let me show you, what happens, when utilities make their own evnt_multi call and set unhandled events to the application:

In this case there are several utilities for an application, all making the evnt_multi call themselves. One of those utilities makes this call, can't work with it and gets it to the application. And now? What should the app do with it? It isn't able to get this event to other utils, but one of'em has to handle it. But all utils won't take any events from the app ...

Due to this an app can use one (window) utility as maximum. If an app uses Magic (by Peter Hellinger) it can't use *any* utility.

14.7.3 misc

Finally an application should be able to set if it doesn't matter if a font is proportional or not (the user can have displayed it if he really wants to). When not using this information the call of a selector can happen much faster!

My favourite selector actually is the one of papyrus, but it only works in papyrus (yet?) [Stefan says: It's my favourite too ;-)]

14.8 About dialogs

This subtopic is quite off topic to this FAQ, but I think it fits here.
Take it as a note by me about Tim Oren [Ore85]

I was quite curious about why I like papyrus' font selector much more than
XUFSL 1.03. This one does include all features offered by the new
libraries. *And* it doesn't break any design rule I've read.
The thougts below are a common proposal, not only for XUFSL 1.03

So I'll try to write, what's disturbing me intuitively [hrrrgn, note by
Stef] And that's not about font selectors but about dialogs in common - but
fixed to a concrete example ...

The popups (with sliders) are, what's disturbing me most.

State-of-the-art user interfaces (Gerd writes "Benutzeroberflaechen", but
in German it's "Benutzungsoberflaechen", the first is the user's skin <g>)
offer selection instead of input (like those *'&" MS-DOS programs). To make
this possible, the selectable thing have to be visible at first sight.

Popups surely can't show everything. And if there are more of'em it's
impossible to take a short look, but one has to take a deeper check what's
available too. Plus one more mouse click to open the popup.

For the theory: Popups are modal parts in non modal (or worse: in modal)
dialogs and modal dialogs are quite interrupting (not only to the user!)

Popups don't fit to the ideas of intuitive user interfaces. I know you're
proud of using Popups (even with sliders) but please: don't use them if
possible.
(Note by stef: file selectors are soon not out of concurrence, there's a
new - non modal - one, released early '95! Looks nice, I recently got it.
FREEDOM 1.0 beta;
Note by Gerd: It uses a different mechanism than described above; it
needs an additional process
Stef: But the server - ''eating`` about 180KB of RAM - can be reloaded
when needed and is ended after use; good thing)

15 Distribution

15.1 Atari

The drivers named with Atari are availabel from Atari.

This Package is available at Atari shops too.

No docs but for this price ...
(That's the way in Germany - other countrys may differ!)

15.2 BELA

The fonts named BELA were available from BELA

There were two disks with packed printer drivers and fonts for them.

The fonts DO have the same IDs like the ones from Atari, but the internal
font NAME is different. Due to this these fonts are correctly not accepted

by some programs if used with Atari fonts.

There's almost no documentation. Not even a hint about the one owning the copyright for the drivers or about the author(s)

One last thing about BELA: R.I.P. ;-)

15.3 Language

The driver named Language is spread on the language disc of the MegSTE

15.4 Internet

The drivers signed with 'I' are to be found in the Internet.
For example: ftp://ftp.cs.tu-berlin.de/...

15.5 Working Title

The WT drivers are spread with Calligrapher. They are (c)Working Title, the wt driver are licensed by Working Title.

No drivers are on the Calligrapher DEMO-disc. The drivers coming with Calligrapher-lite (DM15.-) are signed with CL in the tables.

Screen fonts are on both discs.

15.6 XWindow System

There are PD Speedo fonts from Bitstream. These can be used with Speedo 4.2.
I (Gerd) have no problem using them (even the umlauts are correct)

To find them let Archie (see 11.12 FTP) search as follows:
set search sub
prog speedo-

The fonts
font0648.spd -bitstream-charter-medium-r-normal--0-0-0-0-p-0-iso8859-1
font0649.spd -bitstream-charter-medium-i-normal--0-0-0-0-p-0-iso8859-1
font0709.spd -bitstream-charter-bold-r-normal--0-0-0-0-p-0-iso8859-1
font0710.spd -bitstream-charter-bold-i-normal--0-0-0-0-p-0-iso8859-1
font0419.spd -bitstream-courier-medium-r-normal--0-0-0-0-m-0-iso8859-1
font0582.spd -bitstream-courier-medium-i-normal--0-0-0-0-m-0-iso8859-1
font0583.spd -bitstream-courier-bold-r-normal--0-0-0-0-m-0-iso8859-1
font0611.spd -bitstream-courier-bold-i-normal--0-0-0-0-m-0-iso8859-1

(Stef: These fonts have been spread to German BBS in one package, maybe one helpful soul got it to your next BBS? Some CD-ROMs have them too)

15.7 COMPO

COMPO offer two Bitstream Speedo packets with 100 fonts each. One costs DM99.- Their names are ''OFFICE`` and ''GOLD``
(At your own risk)
The Office pack is good value. The fonts are:

Futura (17) Humanist Slabs 712 (4)
Blackletter 686 (1) Americana (4)
Bernhard Modern (4) Caslon 540 (2)
Blippo (1) Bernhard Bold Condensed (1)
Bernhard Tango (1) Balloon (3)
Bruce Old Style (2) Copperplate Gothic (5)
Bookman (2) Caslon Openface (1)
Caslon Bold (2) Futura Black (1)
Compacta (6) Humanist 970 (2)
Humanist 521 (11) Aldine 721 (7)
Humanist 531 (3) Bernhard Fashion (1)
Humanist 777 (7) Caslon Old Face (3)
Aldine 401 (4) Bitstream Amerigo (5)

Another package with 40 Speedo faces - called ''Intro`` costs DM69.-

Since some time COMPO also offers a CD-ROM with TrueType and Type1 fonts/faces.
These seem to be the same ones as on the StarType CD, but TrueType and Type1
on a single CD-ROM.
The price is DM99.-

15.8 IMG-0300

This is a Freeware GDOS driver for monochrome IMG output. It can be used
as a normal printer driver (21-30 in the ASSIGN.SYS)

In the Internet:

ftp://ftp.uni-muenster.de/pub/atari/Gdos

15.9 FTP

Many students can get software worldwide via ftp. Prices for steady
connections are constant, but connections between America and Europe
have to be paid depending to the volume of data transferred.

Please try not to ftp across the big blue and use short ways.
Use transferring times not in the range of working at the server!
('9 to 5')

Files with known names can be found by Archie.

In Germany:
telnet archie.th-darmstadt.de
login: archie
help

In the US e.g.:
archie.ans.net

Archie will automatically display other archies. use the one thats' closest
to you.

The Archie databases ask about once each month one ftp server after the
other for freely available files

One more small hint: atari.archive.umich.edu ist always totally busy. Not
even mirroring to other servers helps.
Better connect to
- amiga.archive.umich.edu
and type cd atari from there.
This computers have the same HD mounted. BUT: First search your own vicinity!

15.11 SciLab

SciLab's GDOS drivers are not mentioned in the driver's tables though they
are very favourite - specially the colour drivers.

These drivers no langer can be ordered without a program. This is due to the
programs that lots of programs have when using the colour drivers. SciLab
would be blamed then.

You only can get these drivers by ordering a program from SciLab or making
the distributor (of the software you use) licensing those drivers. SciLab
always has 'an open ear' for that. Those are especially the Speedo capable
drivers for HP 600dpi and HP 500C/550C. Actually these are distributed with
Speedo 5 too.

15.12 Star Division

Star Division sells two CD-ROMs (StarType) with 500 TrueType/Type1
fonts/faces. These are mostly complete packages of fonts.
One example:
Zapf Humanist 601 is available as:

o roman
o italic
o bold
o bold italic
o demi
o demi italic
o ultra
o ultra italic

(Stef: and lotsa Swiss 721 ...)

A lot of Bitstream fonts are included. (e.g. Zapf Humanist 601 as noted above)
There are two ITC faces too. In Germany these two CDs are (at least)
available for DM69.- from Vobis. A booklet with a short overview is available
there too.

15.12 Thierry Rodolfo

Thierry Rodolfo made the drivers with T.R. as note.
You'll find them in the BBS BRASIL and on
ftp://hensa.micro.ac.uk/atari/tos/n/n196/...

MEMORY_2 can be found at:
ftp://ftp.cs.tu-berlin.de/pub/atari/GDOS/

15.13 Others

I don't make a choice of drivers. The limit is all of them. The authors (and users) of the programs are asked now to write me, which GDOS drivers come with the programs (With information of: Codelength, Date and known bugs).

A comparison of TrueType collection CDs is found in [Hil95]

Anyone using one of those low priced CD (500 faces for $9, DM15, #6) shouldn't take care of Umlauts (Stef: I still recommend "vowels" for this ...), kerning or a good looking print image. *Then* it's not ugly to use more than 20 fonts on a poster (*sigh!*)

16 GDOS Versions

16.1 The ones from the bones

Atari-GDOS, AMCGDOS, ABCGDOS, NVDI and possibly G+Plus use the same drivers.

16.1.1 Atari-GDOS 1.X and AMCGDOS

The Atari-GDOS is the father of each GDOS coming after it. It's most remarkable character are lots of bugs and it's horrible slow speed. But that's history.

AMCGDOS is faster and has less bugs. But it almost has the same capabilities and was distributed together with Atari-GDOS.
(Stef: Atari GDOS 1.1 and AMCGDOS - 3.21 and newer tested - work with MagiCMac)

16.1.2 ABCGDOS

ABC-GDOS is included in ABC's GEMVDI.PRG. When using this GDOS an expanded syntax has to be used for the ASSIGN.SYS:

driver number driver's file name ; technical info ;
icon text

The first '';`` makes other GDOS version ignore the further information (commented part).

technical info: the driver's real name as available by vqt_devinfo with SpeedoGDOS 7 4.2 or NVDI 7 3.0.

It only works with 68000 based Atari computers - I guess the interupt level is manipulated (Stef: good coding ...)

ABC-GDOS is from The Netherlands and did spread almost not.

ABC ported some Digital Research programs to Atari computers. These programs won't work with other GEM releases than 2.2 (ABC-GDOS). So I'll note them only here:

WordChart, Graph, Paint and Draw

(Stef: hmm, seems to be no big loss <g>)

16.1.3 G+Plus

Does anyone know anything about it?

(Chris: Yes I have some info around somewhere... It is just a GDOS 1.1 clone which runs faster. It also automatically switches the ASSIGN.SYS settings depending on the program being run. A very old GDOS.)

16.2 One step forward

Even though there was a very good GDOS in NVDI, Atari had an open ear to the request of users and coders and tried to raise the capabilities of GDOS.

16.2.1 FontGDOS 2.0

This is a GDOS still using bitmap fonts. It uses own drivers.

The drivers from this package are really much faster than the former ones. (Only bitmap fonts and graphics are comparable of course)

I didn't have any problem using these with other GDOS versions but you must limit to the old fonts.

FontGDOS is the follower of the Atari GDOS. Mainly it differs with the Bezier function and faster (and color-able) drivers. It's got nothing to do with FSM-GDOS or SpeedoGDOS.

FontGDOS is availabel from several companies which use it for their programs.

16.2.2 FSMGDOS 3.0

During the development of FontGDOS, Atari created a GDOS that can handle vector fonts (named OTL in this FAQ). So FSMGDOS isn't a follower of FontGDOS, but was developed the same time. FSMGOS practically was ready to be released but due to massive protest by the developers it was cancelled in the last moment. Except to bundles it never has been distributed officially.

the Imagen outline font format by QMS/Imagen Corp. was used

16.3 Actual Developments

16.3.1 SpeedoGDOS 4.0 and 4.1

See [Res92] too.

The information if it's a Speedo or bitmap font can be found in byte 33 of the Fontname (vqt_name, INQUIRE FACE NAME AND INDEX, VDI 130). zero means bitmap font and one means FSM- or Speedo font.

Some Problems are inportant to be mentioned:

A coder can't find out if a driver can handle Speedo fonts (see last question in 10.3)

Some font IDs are used by bitmap AND Speedo fonts, though different fonts with similar IDs may never be installed the same time.

If you don't take care of this you'll get bombs.

It depends to the user to install the right drivers and fonts. The coder can't help here to stop errors.

The best way is only to install bitmap fonts with the right drivers or to use a Speedo only system.

The monospace font coming with SpeedoGDOS 4.0 has no umlauts (ae, oe, ue ...)

SpeedoGDOS is still in development, ignore the note in [Pru93c].

For installation and coding best is to refer to [Dic93a to c]
Remember starting NVDI before SpeedoGDOS in the AUTO-Folder!

The ones that bought Speedo got 4.0, the Falcon buyers got 4.1

16.3.2 SpeedoGDOS 4.2

Let's see, what Ulli Ramps has to say:

Huhu! [TM] (Stef: Ulli doesn't Huhu, he got bored of it)

The following is a list of changes made to SpeedoGDOS.

1) Line-A - Due to many requests from developers, SpeedoGDOS is now no longer Line-A dependent. All output is done through VDI calls. This was done to make Speedo compatible with various graphics cards, and to make it more multi-tasking-friendly. In addition, users should be able to use various VDI replacements with GDOS.

Another benefit from removing the Line-A dependency is that we no longer have to worry about the scratch buffer used for algorithmic special effects. We have implemented the special effects inside of SpeedoGDOS and the drivers, so that the user/program does not have to worry about the memory needed to accomodate arbitrary sized characters. Unfortunately, this means that old drivers need to be relinked with the new independent library (found in the new driver kit).

There are plusses and minuses of the new implementation of special effects. In many cases, the special effects will be slower. With all previous incarnations of GDOS, you could not use 'bolding' or 'skewing' at non-90 degree rotations; now both of these work at all rotations. On the other hand, 'lightening' used to work at all angles and combinations of effects; now 'bold' mixed with 'lighten' only work at 90 degree rotation angles.

Miscellaneous Note - When using special effects, many applications have a hard time placing the cursor. In both the v_gtext() call and the v_ftext() call, the only cursor compensation to be made is for bolding. Bolding adds the thicken value to the number of pixels of each character. For rotated characters, note that the extra pixels can be considered a vector along the positive x-axis which is rotated at the same angle as the text and added to the advance vector; therefore, the length of the text string should remain the same at any angle. This is true even when SpeedoGDOS generates characters on a scanline basis (when the character does not fit in the character cache),

although it does not implement the special effects. Also, applications should watch for the case when they keep track of the cursor position with vqt_advance() or vqt_width(), instead of vqt_extent() or vqt_f_extent(). In versions prior to 4.2, the application could accurately place the cursor by adding two pixels for every outline character and by adding left and right skew offsets for a skewed string. Now these effects are generated by the outline font engine, so the application must either rely on the extent calls or it must inquire for the advance vectors for characters that are skewed and/or outlined separately. For compatibility purposes, it is recommended that the version number of SpeedoGDOS is checked so that programs can handle both old and new characteristics.

2) Font ID's - Speedo font id's have been promoted to a higher range of ID numbers. This was introduced to avoid conflicts with bitmap fonts and more importantly, with the system font (which conflicted with a variation of Swiss 721). For those applications which use the usual interface with Speedo (i.e. use vqt_name() to find out what the font ID's are), there should be no problem, except if documents have font ID's embedded into formatting information. Of course, all the user has to do is substitute the font. If the application actually goes into the font file header to read the ID, note that we are adding 5000(decimal) to all Speedo font ID's.

3) Printer Driver Incompatibilities - Speedo will now check the printer driver it is trying to load for the '_FSM_HDR' cookie embedded in the driver header information. If GDOS does not find the cookie, it will not allow the loading of any fonts; therefore, you can still use your driver for non-text applications. For future reference, please be sure that the driver header begins on a word boundary for all drivers to be used with this version and any future versions of GDOS.

4) Vst_load_fonts() - We have made two optimizations to the loading of fonts. The first is when a load_font call is made, GDOS checks the date of the extend.sys file to see if it was modified since the last load. A reload used to be mandatory because a bigger scratch buffer might have been required. Since we no longer need a scratch buffer, GDOS only checks to see if a change has been made to the list.

The second change is that GDOS no longer deallocates the global list of fonts if there are no more workstations using GDOS fonts. Therefore, application launches will be faster. On the other hand, the miscellaneous cache never gets cleared of font header information, unless a reboot happens.

5) Memory.sys - The memory driver used to mistakenly open a printer handle.

6) vst_height() - Vst_height used to have a bug in which a maximum point size is reached and then the size begins to shrink. This is fixed.

7) Postscript table - The Postscript table has been fixed (i.e. the indexes were off by 32 for certain Postscript files).

8) Fixed vrt_copyfm() in the drivers.

9) When in 'bicsmode', character 0 was not passed through to the font engine. [Gerd: Speedo can use two different character sets for each font. Once sorted like a normal Atari font and once like a Bitstream font. When using the Bitstream mode, character 0 is space. That's why the recommendation to set a 16Bit char zero terminated (in [San94]) is wrong)

10) Negative point and set sizes - The handling of negative point and set sizes has been made consistent with the original handling in FSMGDOS.

11) The handling of fractional setsizes was incorrect in the drivers, and is now fixed.

12) V_ftext() in the drivers can now handle the offsets passed into the ptsin array.

13) Screen drivers can now safely load as device 10.

14) The memory driver can be loaded residently.

15) vqt_devinfo() - Vqt_devinfo() now returns information, whether or not the device has been opened. Furthermore, the device drivers name, found in the driver header, is copied into the ptsout array; the name is 26 bytes long. Note: if the driver is not SpeedoGDOS-compatible, a null string is returned, and if there is an error, a -1 is returned in ptsout[1].

16) vst_width() - A new call has been added to Speedo. The call is similar to vst_height() except that it sets the width. The bindings are identical except that the opcode is 231. Note: As with vst_arbpt() and vst_setsize(), you must call the general call (i.e. vst_arbpt() or vst_height()) before using the width calls (i.e. vst_setsize() and vst_width()). In addition, the general calls always reset the widths.

Miscellaneous Note: Although these have been published before, many requests have come in for the SpeedoGDOS error codes. Here they are:
Code 1 Out of memory
2 File open
3 File read
4 File write
5 Speedo engine error
6 Character too large (not used, defaults to line output)
7 No room for scratch buffer
8 Character cache error
255 Miscellaneous
These errors are placed in the error code address that applications should provide. Note that if you have MultiTOS installed, GDOS will

report the error to Salert, the system alert box. A revision of the error handling is overdue, since some of the errors are no longer relevant (e.g. code 6), and error code 5 is returned for the lack of availability for pair and track kerning (in addition to the serious errors).

Well, again a big thank you to Ulli!

Now it's me again:

The Installation program for Speedo 4.2 had a small bug yet. If a NEC P printer is selected, NEC_P.SYS ist written into ASSIGN.SYS. But the distributed driver hat NECP.SYS as filename. R.O.M. fixed that.

16.3.3 SpeedoGDOS 5.0

SpeedoGDOS 5.0 was developed by COMPO/no!software using the sources by Atari.
More than Speedo 4.x it can scale TrueType and Type 1 (see 7.2). Price: DM129.-
(at your own risc)

Now 9 printer drivers are included - the additional ones. Speedo 5.0 is an upgrade, so you have the other drivers. But: Which are the old divers? The ones before Speedo 4.1 don't work (and only falcon users have 4.1; the ones who bought Speedo from COMPO in the beginning only got 4.0)

So I at once printed a text using Speedo 5.0, NECP.SYS (Speedo 4.2) and ProList. And? Surprise! It works. That's really astounding because ProList and my own program (see 2) had problems with this driver and Speedo 4.2.

Using the drivers of Speedo 4.0 at least shouldn't work due to the changed jobs of Speedo 4.2 and the drivers.
(Could anyone test Speedo 4.1 drivers with Speedo 5.0? I don't quite believe this works)

Here's how I think an upgrade works (be careful satire)

==========
User: Dear Mr. Compo [...] but my Speedo 4.0 drivers don't work any more.

COMPO: ... best wishes to your decision ... BUT: Speedo 4.2 isn't an official release. It's especially made for papyrus and not useful for other programs. On the other hand...though...seen from a different point...maybe...possibly...Finally you need the drivers from Speedo 4.2. But we don't distribute them. Ask R.O.M. about it ...

[later]

USER: Dear Mr. R.O.M., ...I'd like to get a downgrade, free of course.

R.O.M.: ...don't work...our own costs...bla...etc...better wait for NVDI 3.0, we certainly can put you on the list.

User: "'$&"'$/(!'&!^≠
====================

Well, *I'm* full of anticipation how users that only had Speedo 4.0 will be
able to make printouts.

Versions of Speedo 5.0 until now:

5.0a (Aug. 3rd 1994)
First release

5.0b (Aug. 8th 1994)
From now T1 & TT font loading works faster.

Known Bug: After calling vqt_headerinfo() the files arent' closed again.
Whe using programs making this with all fonts there maybe can be no more
filehandles (the amount of them differs from one TOS release to another).

Since Speedo 4.2 the 'outlined' attribute only works in special conditions.
It depends on the font used, the SpeedoGDOS version, the point size ... and
which Mantra's are mumbled at full moon.

5.0c (Aug. ? 1994)
From here LOWMEM=0 works like noted in the manual.

Now LOWMEM=0 works as stated in the manual.

16.3.4 NVDI up to V2.51

These releases were made of very fast screen drivers and a very fast GDOS.
Compared to Atari-GDOS, NVDI had almost no bugs. But there functions weren't
almost any more functions.

The use of this release is still *very* useful for those
working with SpeedoGDOS 5.0, which doesnt' have a faster VDI ...

16.3.5 NVDI 3.0

From 3.0 NVDI is capable of scaling Speedo and TrueType fonts. Different
from SpeedoGDOS it can't scale Type1. The Behne brothers (correctly!) say
this format has least capabilities and only would blow up NVDI. But lots of
special fonts are only available as Type1 and I could use some of them.
But since the existence of Multiple Master fonts (see 7.3.5) I don't think
the decision was that good ...

A (by principle very good) conversion of the formats is possible but very
difficulty (see chapter 10.8) and no Atari program doing this exists yet. So
the Behne's decision has advantages and flaws.

NVDI's printer drivers are found in 6.8.3

bugs and problems (I know about):

o All released versions of NVDI ignore the pixel size relation. (aspect ratio)
for output of circles and ellipses.
o when calling v_clswrk after vqt_devinfo to a physical workstation creates a
privilege violation when using MultiTOS. Since NVDI 3.02 we got rid of this

bug
o The character mapping isn't compatible to SpeedoGDOS 5.0
o There's no alert when you try to install NVDI (release before November '94) on a full (hard)disk.
o You'll get a memory violation when using the cache CPX with MTOS. Again, NVDI 3.02 fixes this
o Output of rotated text doesn't work with some fonts (e.g. MONACO08.FNT), the chars are always set to 0 degrees.
And bitmap fonts with 8pt or less aren't light when this attribute is set. This happened when using the monochrome driver and the 8pt system font; not woth other fonts or bit depths. Fixed since Nov. 10th '94
o vqt_fontheader get's an incorrect TDF path.
o Track kerning doesn't have effect.
o When a skew angle is set, vector character's positions aren't located correctly. Once a skew angle is set the text is moved to the left or right (depends on the skew angle - positive or negative). This doesn't happen with SpeedoGDOS. Is fixed with NVDI 3.02
o When using MiNT the memory where this NVDI cookie points to write and (that's the problem) read protected.
o When calling vqt_info (VDI 229), NVDI 3.02 only fills the style variable at some faces

Coder's documentation: [Beh95]

16.4 Comments

Users and coders should be happy with the speed of development. Even the numbers of font format included in the programs doesn't have anything comparable on any other platform.

The time between the releases of SpeedoGDOS 5.0a to 5.0c - making one think there wasn't much of betatesting - doesn't satisfy a lot but, on the other hand it's nice to see that the competition by NVDI 3.0 makes the developers hurry.

SpeedoGDOS 5.0 creates problems in some applications that worked perfectly with Speedo 4.x. This may be due to the negative handles that 5.0 uses for the new formats. That's not a bug, because one shouldn't calculate with handles. But some apps do it though.
The coming workaround is the interpretation of handles as unsigned integer (SHORTCARD).

For coders the manuals coming with SpeedoGDOS 5 and NVDI 3 are only a bad joke. Even simple user's questions aren't answered:
TrueType (and Type1 with SpeedoGDOS) are handled. But these fonts are created in platform specific formats. Which ones are handled and what files with what extensions are needed? Without this information both programs aren't very useful.

A ''beta`` of the coder's docs for NVDI 3 is Public Domain and available by ftp or from BBS's [Beh95]. COMPO promised the same for SpeedoGDOS 5.

A provisional coder documentation is free on request when updating to SpeedoGDOS 5. You only have to *know* that it's possible. Sorry for this late information but I didn't know this before too. It's still available (for three Deutschmark in Germany by sending a stamped envelope addressed to yourself). It's 90% Englisch and 10% German, so it's sent to foreign countries too (Stef: try your country's COMPO dealer?)

Here some more differences between NVDI 3 and SpeedoGDOS 5. Get your own clues.

o The driver's concept
A real plus for NVDI 3. They're small, fast and easy to be configured by the user. But they're not able to print with colours yet! And setups aren't to be copied, due to everything set in one file.
o Print to files
NVDI drivers can print in a file and the program won't notice this (SpeedoGDOS can't)
o Need of RAM.
NVDI 3 needs about as much RAM as SpeedoGDOS 5 and NVDI 2.5 (when using the same cache sizes with both GDOS versions)
o Installation
NVDI 3 is begginer-friendly to install BUT: Everything having the same name as a file to be saved is overwritten without any request to the user: META.SYS and the old Screen drivers. This makes different configurations for testing quite difficulty.
But this may be more interesting to coders (and freaks) and they'll be able to rename the old folders before, aren't they ?-)
Only since November '94 there's an alert when there's not enough disc space for NVDI 3.0
o VDI Speed
NVDI 3 is a bit faster than SpeedoGDOS 5 and NVDI 2.5, which is much faster than SpeedoGDOS 5 without NVDI. But SpeedoGDOS 5 and NVDI 2.5 can be enough. This combination is about as fast as NVDI 3 when the fonts used fit into the caches.
o Scaler Speed
Both scalers are the same. Don't look here, why SpeedoGDOS is slower.
o Bugs
Current changes here. I don't know, who actually distributes more bugs.
o Number of font formats
Only SpeedoGDOS has Type1 capability. Some of those fonts are very expensive, but there are special fonts not available in other formats.
o The font's concept
Insiders are fascinated by NVDI's font concept. But you won't get the documentation for "normal coders" from the Behnes. Did'nt even Microsoft lose a t court for such actions?
(Stef: I guess the concept is close to Bitstream's recommendations (font suitcases and more). And Bitstream's docs aren't free too. I talked with the Behnes at the ProTOS fair about it)
o Via cookie NVDI claims to be like SpeedoGDOS 5.0, but (obviously) it isn't. But SpeedoGDOS 5.0 isn't SpeedoGDOS compatible too. Huh? You ask why? Well: There are several versions of SpeedoGDOS 5 (with different

functions/opcodes) and none is documented. Even worse:
Some SpeedoGDOS Version have some experimental functions that aren't
allowed to be used. In the past functions *always* were documented that
it's allowed to call VDI function to check their existence.
(Chris: Aaarrrrgggghhhh!)

17 Source

Being a developer it's possible to get an almost complete printer driver in
object code. This one only must be adapted to the special printer.

This package is available for GDOS and SpeedoGDOS.

18 Tips'n Tricks for users

18.1 Pixeltrash at printing

Printing graphics on a NEC P6+ (maybe other printers too) including a lot of
black in a line I often had the problem that one line was left out (Speedo-
drivers NB15, NECP) or two lines were printed displaced in one line (Speedo-
drivers FX80, NX1000).

This happens when printing directly and via CENSPEED. When using VARSPOOL
this effect is gone.

VARSPOOL can be found on the driver disk of the NEC-printers.

18.2 NEC P6+

Once in a while a NEC P6+ will get noisy (rrrrrrrrrrraattatatattaa).
When You open the front you'll see a round stick (about 1cm thick).
Put two drops of sewing machine oil on it each year (you'll get it from
Mom)

18.3 HP Deskjet 550C, 560C and Deskwriter 510, 520

These printers have a hardware error in the series produced between June
93 and March 94: From time to time the pinch rollers don't work.
Registered users get ''bug fixing`` parts ...

18.4 Overwritten Speedo faces

Sometimes Speedo writes in face files producing interesting effects. To fix
this I have a second order besides GEMSYS filled with the Speedo faces on my
harddisk. If I get strange effects again I copy these files to the GEMSYS
folder. The almost fixes it in most cases.

Since SpeedoGDOS 5.0 I didn't reproduce this.

19 Tips'n Tricks for coders

19.1 Fontsize and Pixelsize

Here are my experiences with GDOS and WYSIWYG. Credits to Ulrich Rossgoderer
for confirming these.

It's about the output of vector graphics and text on screen and printer.

The size of text is defined in point and is always the same - independent
from the resolution of the output device.

Different are vector graphics: they have to be recalculated in pixels before
the output. Should be no problem because when opening a virtual/physical
workstation You get the pixel size in micrometers in devParm[3] and
devParm[4].

Let's assume the vector graphic is saved internally in micrometers, then the
definition points at the output simply have to be divided by devParm[3] or
devParm[4] to get the position in pixels. When doing the output in windows
an offset has to be added. but thats not relevant here.

So far for the theory being quite simple so to this point (see [Gar93]).
Now for the practice.

As described above we output a text and a border - saved internally as
vector graphic. It doesn't matter here if the text is a Speedo or bitmap font.
To have a better chance to compare the border exactly surrounds the text.

Doing this I got the following experineces: The text exactly filling the
border on the screen (ST-high) is - when printed - much too small compared
to the border.

An error in the recalculation of the pixelsize can't be the problem, because
I made the printing with the drivers NB15, NECP, FX80, NX1000 and the results
are the same.

I have only one explanation for this: The screen driver supposes a different
resolution for the pixel size than for the font size.

Two solutions I can offer:

First you can use another pixel size on the screen than the one given from
the operating system. After opening the virtual workstation (and ONLY
this one!) I calculated
devParm[3] := 282
devParm[4] := 282
and with this parameter I made the recalculation from micrometers in pixels.
Now the relation from graphic to text on screen and print-out is exactly
the same. But now a DIN A4 page doesn't fit on the screen in it's width.
The numbers are found by me the experimental way and possibly can be
optimised

Another solution may be this: Use a smaller font size for the screen (and
ONLY there!) by multiplicating the size with 72/96. This is simple with
Speedo fonts because the size in points can be defined by almost endless
values behind the point. Using bitmap fonts this won't work due to not
having a screen font in the 72/96ish size for every printer font.
(Stef: Difficulty to translate this, sorry)

This method surely is to be midified for ST-Mid and other resolutions.

From Wilfried Behne (Half NVDI ...) SpeedoGDOS ignores the devParm[3] and [4] - values of the screen drivers. The values of physical workstations ARE taken.

See 10.7.4 too.

19.2 Selecting drivers

When testing several GDOS programs I found out, that some coders have problems
with the following reasons:

Users can freely assign drivers in the ASSIGN.SYS.
There may be a setup like

23 FX80.SYS
27 NECP.SYS
28 NB15.SYS
31 META.SYS
61 MEMORY.SYS

How may a coder find out which drivers are installed (and ready)? Even though there's no Printer 21?
Quite easy: When the program supports printers ALL drivers from 21 to 30 are to be opened and closed again at once. An installed driver gives back a devicehandle >0 when being opened. vf_devinfo gives back correct values when a driver is opened.

Do the same thing with drivers 61 to 70 when MEMORY drivers are supported.

The ASSIGN.SYS as printed above is very useful. That's because the NEC P printers support all these drivers and print in different resolutions.

19.3 The Metafile format

If been asked to count, what i don't know about Metafiles 8-)))

By the idea the Metafile format is quite simple. It's a recording of VDI calls (including parameters) made by a program.

A program making it's output via GDOS will open a Metafile driver instead of a printer driver (see 6.8) and the output will get there just as if it were a printer.

A Metafile reading program recreates this recording.

But the simplicity of this format is one of the biggest problems of metafiles because different GDOS releases exist and different drivers with different capabilities. So, one programs makes output being understood by the GDOS actually installed. When this Metafile is read by a program running under a different GDOS with less or different capabilities, how can the recording be recreated?

Concrete examples:
The length of ptsin and intin fields is limited (different for different drivers) usually. The Metafile driver can handle this in another way.

This can have influence to text output, poly line & marker, filled area
and more ...

Next problem:
A font face not available on the output system is used. In which way another
(most similar) face has to be requested by the program making the output?

(If possible) the coder should at least select the face by the name and not
by the ID because NVDI 3 and SpeedoGDOS 5 use different IDs. SpeedoGDOS
5.0's META driver always writes the face's name into the metafile, even if
the font is selected by ID.

At this point, this is a problem to be handled by the coders of the
reading graphics programs (who willknow, what they're doing).

But when writing a metafile header you have to know, what you're doing. I
don't but I'll give it a try ;-)
The resolution set for a metafile is a decision of the application. If
there's no resolution set, 300dpi are used. That's a pixel width of
0.085mm.
Screen drivers are only capable of handling raster coordinates. For
metafile output the same routines are used, so I'll limit the next info to
raster coordinates (even though metafile can handle NDC's). Those
coordinates are defined from upper left to lower right.

To define a system of coordinates, metafile do this:

o (W)idth and (H)eight are set in millimeters (mm) via vm_pagesize.
That's the (positive) difference beetween the lower right and upper
left corner (which doesn't have to be in the origin)
o The rectangle (xmin, ymin, xmax and ymax) is defined in pixels via
vm_coords. The way to calculate this rect. is found below.
o Here inside another rectangle is defined in pixels via v_meta_extents.
It's got nothing to do with the system, the MF reading application
get's info how to clip (what doesn't *have* to be done!)
Note: papyrus doesn't clip; kandinsky does, but it moves the graphic
to the lower right a bit making miss a bit of it on the screen.
So it could be useful to set the size for v_meta_extents a bit
larger than the one for vm_coords.

This way the system of coordinates, the resolution (width and height of a
system) has a fixed definition.

But the veriables set aren't the ones an application usually calculates
with.
Here's an example what's to do, when the application knows the resolution
wished (in dpi), the upper left (X1,Y1) and the lower right dot in tenths
of a millimeter (or a multiple of it).

Here's how to get the width and height of a pixel by the resolution:

25400
(Pixel height in tenths of a millimeter) = --------------------

vertical res. in dpi

25400
(Pixel width in tenths of a millimeter) = ----------------------
horizontal res. in dpi

(W)idth and (H)eight (in millimeters) are needed for vm_pagesize:

W = (X2 - X1 + 1) * (Pixelwidth in 1/10mm)
H = (Y2 - X1 + 1) * (Pixelheight in 1/10mm)

xmin, ymin, xmax and ymax (in pixels) are needed for vm_coords:

X1
xmin= --------------------
Pixelwidth in 1/10mm

Y1
ymin= ----------------------
Pixelheight in 1/10mm

X2
xmax= --------------------
Pixelwidth in 1/10mm

Y2
ymax= ----------------------
Pixelheight in 1/10mm

v_meta_extents is found the same way as vm_coords. To make Kandinsky
display everything, xmin & ymin can be set smaller and xmax & ymax larger.

Before making any output into a MF, first set the system of coordinates.

(In the early past I noticed, that my desriptions are that good, that even
I understood them <g> [Stef:I hope the translation is that good too])

Further informations:
Ulrich Rossgoderer coordinates a list of further informations to put
in a MF via v_write_meta (See version 2.4 of this FAQ). The Profibuch
[Jan92] the Atari Compendium [San94] and the standard book "Ueber
FIleformate [Bor94] contain further information. And every literature
about VDI calls is helpful, too.

20 Expanded Sub opcodes for metafiles

Metafiles have one important predicate: The reading application has to
ignore unknown calls. But it can use any sub codes that can be written in
a metafile by v_write_meta.

The information of this chapter once was created to be a standard, but,
well it didn't get to be. Maybe it wasn't the time for it there were no
SpeedoGDOS and no media to promote it.

The definition following now should at least be supported for *not* using sub opcodes for any other purpose. If *any* program uses this definition please send me information!!!!!!!!!!!!!

Here's an extract from the KandinskY manual:

Kandinsky uses the *.GEM format to save and load drawings - as noted several times before (i.e. the Metafile format).

This format can be (compatibly) expanded almost without any limit using user defined sub opcodes.

KandinskY uses some special sub opcodes, e.g. to save and restore fine grey scale setting, window positions and more. Besides sub opcodes I know are supported.

KandinskY's saving routines are coded in a way not recommending that another Program - loading a drawing created with KandinskY - doesn't *have* to understand these sub opcodes. There shouldn't be any difference in the display then. Problems can occur if a program makes a wrong interpretation of a sub opcode. That's because of value overlapping (sp?)

So, if you dear reader use your own sub opcodes too:
It would be great sending me (Ulrich Rossgoderer) a short description of them. Because the use of the extension only makes sense if sub opcodes of the same value are interpreted the same way by any meta file using program. I have a list in mind describing any used sub opcode with their meaning (like the XBRA list).

Refer to the Profibuch [Jan92] for more information about sub opcodes. They're mentioned in the chapter about VDI OS routines. Take a special look at the v_write_meta which is used to write sub opcodes into a meta file.

20.1 Supported sub obcodes

First here's a short overview about supported sub opcodes . Table 1 lists the names offered, their obligatory values the their results.

Name	value	short decription
GEM_START_GROUP	10	Group begin
GEM_END_GROUP	11	Group end
GEM_NO_LINE_STYLE	49	Switch off any line style
GEM_START_SHADOW	50	Object shdow begin
GEM_END_SHADOW	51	Shadow's end
GEM_START_FILL	80	Filled plane begin
GEM_END_FILL	81	Filled plane end
GEM_START_BGIF	170	BGI vector text begin
GEM_END_BGIF	171	BGI vector text end
GEM_WIND	190	Window position, Zoom value etc.
GEM_GRID	191	Raster settings
GEM_ALIGN	192	Reference object's informations
GEM_START_GREY	193	Gray value begin

```
|_GEM_END_GREY_______|_194_|End of it_________________________|
| GEM_START_BEZIER | 195 |Bezier begin |
|_GEM_END_BEZIER_____|_196_|End of it_________________________|
| GEM_START_JOIN | 197 |Following blocks are one unit |
|_GEM_END_JOIN_______|_198_|... from here no more____________|
```

Table 1: Sub-Opcode overview

The next subsections are a drscription of the functions listed here.

20.2 group information

GEM_START_GROUP marks the beginning of a group, i.e. a couple of objects belonging together. Their end is marked by GEM_END_GROUP

20.3 object shadow

The VDI calls between GEM_START_SHADOW and GEM_END_SHADOW are used to set are used to draw a shadow for the first object *after* GEM_END_SHADOW.

20.4 filling area

Borders around VDI planes aren't always drawn correctly. That's the reason for the existence of GEM_START_FILL AND GEM_END_FILL.
All VDI calls included are used to draw a filled plane with or without border.

As a description the drawing of a polygon with shadow and border is made step-by-step here:

o GEM_START_FILL
o GEM_START_SHADOW
o Setting filling attributes for the shadow
o v_fillarea(...) offset by dx and
o GEM_END_SHADOW
o Setting of filling attributes for the plane
o v_fillarea(...)
o Setting of line attributes for the border
o v_pline(...)
o GEM_END_FILL

20.5 vector text

GEM_START_BGIF starts text output with BGI vector charset. Here are the functions of the VDI arrays:

```
_____________________________________________________
| intin[0] GEM_START_BGIF |
| intin[1] 0: not proportional |
| intin[2...10] Name, z.B. EURO: intin[2] = 69 ... |
|_intin[11...]__Text with zero at the end___________|
| ptsin[0] The text's x-coordinate (in 1/10mm)|
| ptsin[1] The text's y-coordinate (in 1/10mm)|
| ptsin[2] Letter width (in 1/10mm)|
```

```
| ptsin[3] Letter height (in 1/10mm)|
|_ptsin[4]______Rotation______(in 1/10 of a degree)|
```

The v_pline(...) calls before GEM_END_BGIF are set if a program can't make use of these sub opcodes needed to display text.

20.6 window settings

20.6.1 window position

GEM_WIND sets position, magnification value and format of a window.

```
_____________________________________________
| intin[0] GEM_WIND |
| intin[1] The window's x-Position in pixels|
| intin[2] The window's y-position in pixels|
| intin[3] Window's width in pixels|
| intin[4] Window's height in pixels|
| intin[5] Slider's x-position in pixels|
| intin[6] Slider's y-position in pixels|
| intin[7] Zooming value in percent|
|_intin[8]__0:_vert. format,_1:hor. format___|
|_ptsin[...]_no entries_____________________|
```

20.6.2 raster setups

GEM_GRID permanently saves a window's raster setup.

```
_________________________________________________
| intin[0] GEM_GRID |
| intin[1] 0: Raster inaktive |
| intin[2] 0: don't draw raster |
| intin[3] Rasters' width in 1/10mm |
| intin[4] Raster's height in 1/10mm |
| intin[5] help line's hor. distance in 1/10mm |
| intin[6] help line's vert. distance in 1/10mm |
|_intin[7]__0:__help lines_,_else:_help_dots_____|
|_ptsin[:::]_no_entries___________________________|
```

20.6.3 reference object

GEM_ALIGN describes the reference object

```
_____________________________________________________
| intin[0] GEM_ALIGN |
| intin[1] 0: don't show reference object (RO) |
| intin[2] RO's x-coordinate in 1/10mm |
| intin[3] RO's y-coordinate in 1/10mm |
| intin[4] RO's width in 1/10mm |
|_intin[5]__RO's height_____________in_1/10mm_|
|_ptsin[:::]_no entries___________________________|
```

20.7 gray scales

Here are the calls to set a gray scale for to fill an object. Values
between zero to 255 (white to black) are possible.

```
_______________________________
| intin[0] GEM_START_GREY |
|_intin[1]__Gray scale, 0-255_|
|_ptsin[...]_no etries________|
```

A user defined pattern with the gray scale set is set between
GEM_START_GREY and GEM_END_GREY. Again they're only set for programs
unable to handle these sub opcodes.

20.8 beziers

A bezier is defined with GEM_START_BEZIER. All informations are found in
the intin and ptsin fields.

```
_____________________________________________________
| intin[0] GEM_START_BEZIER |
| intin[1] recursion's depth <5!! |
| intin[2..2n + 2 - 1] anchor point's attributes |
| corner: Bit 0 set |
| moves: Bit 1 set |
| visible: Bit 2 set |
|_____________________Line_instead of bezier:__Bit_3_set_|
| ptsin[0..4n - 1] The n bezier segment's coordinates |
|_____________________four points each_____________________|
```

Guess what? Yeah, the v_pline calls until GEM_END_BEZIER is set draw a
polygon for programs unable to handle these sub opcodes (Stef: hmmm, good
thing to think of those old fashioned programs <g>)

20.9 VDI block summarizing

To save more coordinates than allowed by the metafile driver
GEM_START_JOIN is used. If KandinskY discovers this sub opcode, the ptsin
fields between ..START.. and ..END.. are used to summarize the following
VDI blocks to a large field

```
_____________________________________
| intin[0] GEM_START_JOIN |
|_intin[1]__total of coordinate pairs_|
|_ptsin[...]_no entries_______________|
```

This definition can be used - besides v_pline, v_fillarea and v_pmarker -
for v_gtext, v_justified and v_ftext too yet.
Text longer than one line can be saved this way too. The following
definition is used then:

```
_____________________________________________
| intin[0] GEM_START_JOIN |
| intin[1] value of following v_gtext calls |
|___________(one each line)___________________|
|_ptsin[...]_no entries_______________________|
```

The first VDI output call following GEM_START_JOIN is used to mark this
further definition of intin[1].

Well, so much for this extract of KandinskY's manual.

21 Addresses

(Lot's of stuff is available from the friendly Atari dealer 'around the
corner ;-/)

(Note: All addresses are German ones - except when marked!)

22 Miscellaneous

22.1 Critics

22.1.1 Critics to the author

Critics are greatly welcomed. To get more info, send email to:

G.Castan@physik.uni-stuttgart.de

Possibly one writing me has already tested two or three drivers.
Please write me if the errors listed above occured or not.

Anybody knowing different driver support addresses, please write me an
email.

22.1.2 Critics to the translator

Hi, this is Stefan writing :-)= (Huh? Yeah, a goatee)
Why I wrote this translation? In the former versions of this FAQ I
claimed not to know the reason exactly. Well, it's quite obvious:
Support the TOS fans all over the world (hmm, at least those
understanding *my* English*)
If you find some errors in this translation, please don't send them to Gerd
but
to me:

cookie@cookie.syd.de

Referring to the feedback on this translation there seems to be ANY error in
it.
It would be interesting to me, WHO is happy with this FAQ, so send me
postcards, discs, books, whatever you want - no mail bombs please ;-)))

Thank you and have fun and lot's of experience with this FAQ.

Bye
Stefan

22.2 Praise

If this FAQ helped you out of a problem, please write me a postcard in your next holidays.

Postcards I received yet: 2 (Chris Ridd visited Marrakesh)

22.3 For my support

Due to actual experiences I ask the distributors to switch on verify when copying update disks.

I only know two distributors not making any problem with this.

Does one of the readers want to code a Speedo font editor? We (Gerd & Stefan) offer our time to beta test it ;-)

22.4 Trademarks

This document is full of trademarks, no to be used freely.

22.5 Guarantee

I'll offer no guarantee.

23 Literature

[Whe88] Douglas N. Wheeler,
EVERYTHING YOU EVER WANTED TO KNOW ABOUT GDOS (AND MORE)
(Internet, Filename: GDOS.ARC oder GDOS.TXT)
Here's written all what's important to know about GDOS drivers.
(AND MORE)

[Jan92[Jankowski, Rabich, Reschke
Atari Profibuch [Professionals book]
10. Auflage, SYBEX, Duesseldorf (1992)
The Standard. For Coders: In the VDI part you'll find how to use screen and printer drivers correctly.

[San94] Scott Sanders,
The ATARI Compendium, first revision, SDS Publishing,
Long Beach '94
Another standard. More actual compared to the Profibuch (VDI calls up to SpeedoGDOS 4.2) and very complete. The official GEM useri nterface guidelines are included too! But it can't replace the Profibuch.
A plus is the list of operating system functions, from which release they're available and which way their existence can be requested. If this FAQ ever will have a chapter about layout, this book will be an example. A negtive one, though.

[Gar93] Marc Rene Gardeya

Hello android van den Berg! The 29.08.95 you talked about "TOS question",and my reply is:

>> > It might of only been available on US machines but it did indeed
>> exist!
>> I have a Swedish machine. With Swedish TOS 1.62
>>
>> So its not only US.
>>
> Sorry, my mistake. I just got confused by the awkward 'spelling' :
> TOS 1.06.2 instead of 1.62 .
> I still cannot get used to those changes Atari made afterwards in the
> numbering (for no apparent reason).
>

No. Its a bit silly ;)

> Does this also mean we can call M$ Windows95 Windows 0.95 instead ? ;-)
>

Why not :-)

Grtz from Sweden:

Chris Cracknell (ad329@freenet.hamilton.on.ca) wrote:
: Can anyone recommend a PD or Shareware programme for the ST that'll allow
: me to create a Web Home Page (I guess I'm looking for a HTML editor)?

The easiest way would be to write it in an ASCII text editor. I can email
yuo with some basics on how to do this if you are interested. Or look on
my homepage, wher there is link to the HTML Primer - tells you all you
need to know on making web pages. But it may go into too much detail if
you are a beginner.

Hope that helps.

Vaporware Mistake, Eh?

I dunno. I'll have to check my hypertexts in my home office.

Someone may know if the specs are easy to get to. The only VME cards I've dealt with are graphics cards, although there is at least one good network card for the MSTe/TT in the VME design.

Possible, but the manual says that the basic code uses a cut-down version of the sampling routines, so quality might suffer a bit...

Giles.

3118. Working TOS dumper!

Newsgroup: comp.sys.atari.st
Date: 1995-08-31 00:00:00 UTC
From: CALLUM.LERWICK@flight.org
Message-ID: <66a_9508311530@flight.org>
Source record: 159803
Body handling: 1 inline base64-encoded payload block was not displayed

I have just wrote a TOS dumper, works fine on my TOS 1.0 machine, I see no reason why it won't work with other TOS versions, but of course I can't test it. Here it is:

This MIME-Encoded message was created with ESS-Code 6.3, for the
Atari (Mega) ST(e)/TT/Falcon. The same utility can be used to decode
this message, or the MUNPACK utility (UNIX, IBM, Amiga, & Macintosh)
can be used instead.

3121. WTB: Monitor Master (or such device)

Newsgroup: comp.sys.atari.st
Date: 1995-08-31 00:00:00 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <4258dj$8p5@golem.wcc.govt.nz>
Source record: 159806

Okay, I'm after one of these switchboxes for the ST & a color & mono'
monitor that lets you plug both in at the same time, and select them
with a switch rather than plugging & unplugging the separate monitors
all the time. I don't know if you can still get them new as someone
has moved my Toad catalog and I can't find it :(

So, anyone with a "Monitor Master" they want to sell to me, the cheaper
the better, please contact me, preferably in email at this address,
but a reply on this newsgroup should do the trick :)

Even if someone could _make_ such a device more me, I'd make it worth
your time. ^for
I can't imagine them being too complicated, but I'm hopeless with making
electronic type devices...

Gerrit_Meyer@ol2.maus.de (Gerrit Meyer) wrote:
>I'm sorry to say that a RAM DOUBLER is NOT possible for any Atari.

Bullshit! Trying to use memory outside exisiting RAM will create a bus-error trap. You can install your virtual memory management routine on this trap. Whenever this trap occures, alter your memory mapping to suite and continue what you were doing, losing time only for each page fault. However, this is possible only if you have an MMU. You'll find MMUs on any 68030 or better, meaning that the TT and the Falcon can both do this. Doing it on a 68000 would be somewhat harder, but still possible. The trap routine can't swap pages without the MMU, so you'd have to emulate the instruction that invoked the trap routine before returning to the _next_ instruction. Running a program in virtual memory would be gross, but any allocated data would be "ok" - just TERRIBLY slow.
With the MSTe's VME-slot, however, it should be possible to create a little black box which allowed you to swap pages on RAM > 4Meg. Would need some hell of an engineering, but it should be possible.

>If it was possible, someone would have written a doubler already. Especially
>demo coders like me would have had something like a ram doubler soon.

There is a Virtual RAM program for the Falcon. A demo version which gives you 6 Megs if you have 4. It's a bit slow, but the final and commerical version should be faster and allow you to tell the computer how big swap file you want.

As for RAM doubling, this is the same as swapping, except that instead of swapping to disk, you swap to a compressed RAM disk.

>If you already got 4 Megs, you have to buy a TT or Falcon. If not, buy SIMMs.
>This is the only way to get more memory.

Bull! An ST can address 24 bits. However, "negative" addresses have been set off for I/O, so you can only use 23. If you don't have any sort of expansion port with all address lines (like the VME slot on the MSTe), there's noone stopping you from hacking your hardware a little... ;^}

But the bottom line is - nothing is _impossible_... ;^]

Actually, there's a company on the net (don't remember where, but I'll try to dig it up again) which sells VME soundcards and DSP cards. The VME bus is the "professional" multitasking bus which Cern and people like that use. I have a PC card in a black box attached to a PC->VME bus converter thing (i.e. Nova VME graphics card for MSTe/TT). In the comp.sys.hardware.homebuilt FAQ, there's a information about the PC bus, so documenting the needed parts of the VME bus should be just a matter of following the lines on the converter thingy and taking the address convertion it does into consideration. I'll see if I can have this done during the weekend if I get the time. Otherwise, you can find more information about VME at Cern's WWW site, with the address of the company behind the VME bus, where you can buy the full documentation.
I'm gonna hack the stuff anyways, since I'm very interested in the information myself.

SYSTEM FOR SALE:

Hardware:
Atari Falcon030 w/ Internal HD Floppy Drive (like new!)
4MB RAM
85MB Hard Drive, partitioned for Falcon Speed
Motorola 68882 FPU
Falcon Speed 6.2 DOS Emulation Daughtercard w/ software
Supra 2400 Modem w/ cable
SCSI-2 Cable to attach an external drive (drive not included)
VGA & RGB Video Cable Adapters -- use a PC monitor!
Latest CPU Modification
Mouse
CPU & mouse covers
Surge Protector

LOTS of software -- almost 100 floppiesï¿½ worth -- such as:
Truepaint (painting/drawing)
Ishar (game)
AtariWorks (word processor / database / spreadsheet)
Chaos Strikes Back (game)
Castles (game)
The Immortal (game)
Hostage Rescue Mission (game)
Dragon Lord (game)
STalker 3.04 (telecommunications / modem software)
STeno 2.11 (text editor)
DOS / Windows 3.1 installed on hard drive, w/ utilities, etc.
LOTS of shareware/freeware/demos
and more....

Comes with all necessary cables, original system disks & manuals. Asking
$1150, but make me an offer!

3130. Help needed: Atari disks on Macintosh

Newsgroup: comp.sys.atari.st
Date: 1995-08-31 00:00:00 UTC
From: bspin@iaehv.nl
Message-ID: <bspin-3108951540430001@pm1d20.iaehv.nl>
Source record: 159815

Sometimes I have to transport data from my old and still useful Atari to my Macintosh. It worked pretty well, until after installing sys 7.5, Apple File Exchange did not to run anymore. This was the only program I could find that could to the proper conversion. Now I have to reinstall sys 7.1 every time to read a Atari disk. Is this a common problem? Is there another way to get data from Atari to Macintosh?

TIA

Bert

I'm writing this small announcement that from tommorow 1st September my current email address msh@dl.ac.uk will no longer be vaild and that you should use my new and permanent email address dlms@nessie.mcc.ac.uk. Please also note that I'm going to be off the net for a few weeks until roughly the 25th of September so please be patient if you write to my new address and don't get an answer. I will deal with all mail when I return and and will clear the 40+ backlog I have at the time of writing this.

Whilst I'm away the Atari Web pages will obviously have a bit of a holiday, but believe me it will be under a major set of revisions, improvements and additions when I return as I have tons of updates just waiting to be included and I'm designed graphics to improve it's appearance.

See you all in just over three weeks. Take care!

Ahem. MagiC does not need HSMODEM. MagiC's own TOS serial-port routines
were written with help from the HSMODEM author. MagiC's TOS does not need
such a patch.

Al

Where does this kind of comment come from? STalker works under MagiC, and
its Zmodem routines are fast and reliable. CoNnect works very well under
MagiC, Zmodem ditto. Flash II 3.0 works under MagiC, Zmodem ditto. Storm
works under MagiC, Zmodem ... you get the point.

> piece of software without proper hardware to support it.
> But _one_ program got it implemented very well, namely Cranach Studio.
> It uses virtual RAM on any ST and is quite stable and reasonably fast.

Yes - but this program is probably only doing Virtual Memory for itself. I'm not familier with this program myself but it is almost certainly using some sort of overlays or paging - much like Expanded memory on the PC. This can be done without extra hardware (though PC Expanded memory does have some), but isn't true Virtual Memory as each program in question needs to rewritten to do the overlays. Some programs (eg GCC) are not well suited to this sort of thing.

> BTW I think a ram-doubler is not the same thing as virtual RAM. A
> RAM-doubler uses realtime compression AFAIK.

I disagree. The Ram Doubler may use realtime compression - but there is no reason why Virtual Memory cannot use realtime compression either.

In the simplest form just assume there is realtime disk compression. Any data stored to the disk by the Virtual Memory software will automatically become compressed.

If you are only concerned about compression whilst in memory - then consider that the Virtual Memory partition can be on a RAM disk in theory at least. Add real time disk compression to the RAM disk - and suddenly you've 'doubled' the amount of available RAM! Actually the compression ratio would be a trade off between the size of the RAM disk against the remaining free RAM. The larger the RAM disk - the better the compression ratio - but the slower the performamce - as each and every memory block stored in the ram disk needs to be de-compressed into real RAM before it can be used.

Still all needs a MMU which for most people means a TT or Falcon.

All IMHO and AFAIK,

:-)

Roland.

I thought this memory was supposed to appear like TT-RAM, and TOS would
automatically allocate it based on the memory allocation flags in the
program header.

Having said all that - I did read that several well know pieces of
software were unhappy with it - even though they should have worked.

All IMHO and AFAIK.

:-)

Roland.

unless someone can write a TSR that checks incoming text for a specific set
of text and then sends 'EXIT<CR>' out of the modem port.

It has steadily been getting thinner for the past year, and the list
of advertisers has grown shorter and shorter. I have to pay US$8.65 for it,
and five months ago I quit buying it. Now I just browse at the local bookstore
with pen and paper in hand to jot down anything of use.
Which happens once in a blue moon, but I think that's just typical
of concentration on the user instead of useful stuff the 8bit mags had in
them.(Antic, AtariLog)

> Memory for free.

> All IMHO and AFAIK

> :-(

The SUN 1 was a 68010, not a 68000. This was the only major machine to
ship with said chip. Virtually all other computer manufacturers skipped
this 16-bit chip and went to the 32-bit 68020.

The MMU _designed_for_ the 68010 was known as the 68451. This was a simple base/bounds MMU, and was something of a commercial disaster - very few machines shipped with it installed. (I do not believe that it would work in a 68000 system, but am ready to be proven incorrect).

The 68010 would require alterations to TOS to run on the earlier ST's, as its exception/interrupt stackframes differ from that which the 68000 expect. As the early versions of TOS were designed around the 68000, a complete TOS upgrade would be needed. (I believe TOS 2 would suffice, but, not having laid my grubby mitts on it, I am unable to state whether it will work properly.)

AFAIK the Lighthouse and Desktopper don't contain a power supply. Myself
and a friend recently put my TT and his Falcon in bog standard PC tower cases.
There was a bit of metal cutting involved, but in the end it was worth it.

Phil

w> what the thinking on this ?

Errm...dunno the answer to your question but if you are not using SEMPER
mailer I wouldn't bother using HSMOD as the Magic serial stuff is OK. For
some reason SEMPER won't work without HSMOD being there though.

Hi,

I have a Atari Transputer Workstation ATW 800, board rev. 4.5.
I'd liked to connect my Multisync Monitor to the RGB-connector on the
ATW. I think, my monitor isn't able to sync-on-green, but the graphic-
adaptor of the ATW seems to have H-Sync and V-Sync.

Is there anybody who has already solved a similar problem? Who can help?

It's a nice idea. I can only think of using a macro program so you can record it
all but it might be a bit tricky. If you have Tos 2.06 the assigning the program
to a function key and then running the Macro would make thinks easy, but the
problem is that there is no easy way to know when NOS has finished and tell the
Macro to close it unless you can find a macro system that allows simple
commands, if you find anything i'd love to know!

From: rhett@bigwpi.WPI.EDU
Message-ID: <423323$fj8@bigboote.WPI.EDU>
Source record: 159865

Well, I may have found a Falcon I want, but i need to sell this system first so here goes:

Mega STe 4 (16 MHz) with internal 170 meg Hard Drive
Sc1224 color monitor
Math Coprocessor chip, not installed
Mouse and all system software
USRobotics 9600 baud external modem
1.44 Floppy drive upgrade

As you can imagine, quite a bit of software and programming manuals, etc included (A CRAP LOAD)

Will entertain offers starting at $750. If you would like more info let me know, but i would like to sell this soon. If you do not like my price, please keep it to yourself. I do believe it is fair and it is what i need, nothing more.

Thanks

rhett@wpi.wpi.edu

3165. Spectre etc.

Newsgroup: comp.sys.atari.st
Date: 1995-08-31 00:00:00 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <4237o3$q1a@golem.wcc.govt.nz>
Source record: 159866

This morning I was told of someone giving away free an Atari system, consisting of Atari SM124 monitor, Spectre GCR cartridge, 1040STFM computer and Megafile-30 hard disk. Amazingly I beat everyone else to it, and all goes well except for one small problem.

The Spectre GCR comes with the software on the hard-disk and the cartridge. No manuals, and no proper Spectre GCR install or utilities disks. And, bigger problem, it's version 2 of the software.

Is there any kind soul out there who I might possibly be able to get copies of the v3.1 disks from? I know it's bordering on piracy, but 2 major problems prevent me from getting it otherwise. Gadgets by small no longer exists, so I can't get it from them. And, it's not as if the disk would be a lot of use without the cartridge.

It all goes, I just need the newer version of the software.... Now I'm running on a nice 4meg machine with color & mono' monitors, GCR, hard-disk etc. Just what I've been working on, a fully-upgraded 1040STe with all the extras, now I just need a PAK-030 :)

So, anyone out there able to help me out?

A listing of the key-commands would be good as well, all I can remember from the last time I had one (I only had 1meg, and it was too painful to use, so I sold it), is that Control Maps to the key with the squiggle on it, and Control+F1, F2 etc. forces a media change on the appropriate drive....

Help!

3166. WAV, wierd types?

Newsgroup: comp.sys.atari.st
Date: 1995-08-31 00:00:00 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <42389g$q1a@golem.wcc.govt.nz>
Source record: 159867

I've been getting a few WAVe files from local BBS's lately, and I notice that some of them seem to be non-standard. I try playing them and they sound as if they're signed when they should be unsigned or vice versa, but changing the sign makes little difference. I can make out the sound behind a lot of static etc. But 525 gives me "Unsupported File Format" and sound-lab will try playing it, but Signed or Unsigned, it sounds a mess. But, for other WAV files, either program will deal with it quite happily. Any ideas? (The files don't appear to be compressed in any way, as having a look in the file itself, the headers seem to be as they should....) Is there more than one type of WAVe format? (Other than differing speeds?)

>Has anyone got any comments about either the lighthouse tower case or the
>desktopper case for a falcon?

I have a Desktopper, it's a bit flimsy but there's lots of space inside, I have 3.5" IDE and PSU in it with easily enough space for a CDROM and possibly a 2nd drive. The front of the case has two plastic inserts whch need to be cut to make space for a drive which you need access to, such as a CD ROM - a bit cheap and tacky looking.

You will need Freekeys to go with it, this takes
your keyboard out from the Falcon (or ST) and puts it in a new case. The
cost from Sys Sol last time I looked was £100 for both.

There are some hidden extras, you can mount the power switch and reset
button at the front for another £15 and the SCSI kit is even more.

I don't know about the Lighthouse case, but I should give Sys Sol a list of your requirments and ask for a quote for both cases.

The other option is to get a PC tower case and adapt it.

Phil.

3168. Lighthouse or desktopper users?

Newsgroup: comp.sys.atari.st
Date: 1995-08-31 00:00:00 UTC

Has anyone got any comments about either the lighthouse tower case or the
desktopper case for a falcon?
I am looking for a new case, and these are the two choices I have found
so far.
Do these come with a power supply and/or keyboard?
Are they worth the money?

Thanks for any help,
Phil

3169. Comms prg for MagiC

Newsgroup: comp.sys.atari.st
Date: 1995-08-31 00:00:00 UTC
From: wongck@ti.com
Message-ID: <wongck.256.00086A17@ti.com>
Source record: 159870

Here's another question on MagiC. Started to use MagiC since my TEC board decided to go on a journey of no return.

Is there a good _ANSI_emulating comms program which works for MagiC ?
I tried Connect but I am not satisfy with it, it's a far from ANSITERM in terms of the colour. (Connect have lots of niffy stuff but I want the colours)

Isn't there a 16 colour ANSI comms program like ANSITERM which works on MagiC?
ANSITERM works in single mode but doesn't release back memory to the kernel, and spawning Starfall's XYZ.PRG Zmodem xfer program from ANISTERM does not work.

So in a nutshell... what are the recommendations for 16 colour ANSI comms and Zmodem xfer prg for MagiC ?

Regards
William

C:WINSOCKKA9QSPOOLMAIL (robert@hipovert.demon.co.uk) wrote:

: I have two 50meg Gastiner SCSI hard disks for my Atari STE. Each
: has a controller built in. To link both to my Atari at the same time,
: I need to change the SCSI ID of one of the drives. Does anybody know
: how to do this? I have read the manuals and it says "just change the
: jumper leads inside the drive". I have opened up one of the drives and
: found no leads to change!!

There should be a set of SCSI id jumpers on the back or bottom of the drive.
They are usually on the back next to the SCSI connector :

```
_____________________________ __________
::::: |:::::::::::::::::::::::::::::| | * * * * |
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~ `~~~~~~~~~'
Jumpers SCSI connector Power
```

There are 3 jumpers to set the SCSI id in the range 0 to 7. They work as
bits with values 1, 2 and 4. The usual setting is all open, SCSI id 0.
If you want :

SCSI id Jumpers to make
0 -
1 1
2 2
3 1, 2
4 3
5 1, 3
6 2, 3
7 1, 2, 3

If there are more than 3 jumper pins next to the SCSI connector, you will
have to work out which are the SCSI id ones. If it is a Seagate drive, I
think there are 5 connectors, with the outermost three being id1, id2, id3.
There might even be text on the board next to the jumpers.

The machine will boot off the drive with the lowest id, so set your second
drive to (say) 1. If you are using AHDI, you must set the id's to 0 and 1,
as AHDI looks for devices starting at id 0 and then stops if there is an
id with no device.

I'm pretty sure there was a MegaSTe-specific version of this, because it requires
TOS 2.06 (standard in most MegaSTe machines) and I remember contemplating buying
one when it first came out, but... ah, the price!!!

Source record: 159876

Is anyone doing anything good with this? It seems like Douglas Little
is too busy beavering away on awesome Falcon stuff to cater for us
poor ones with STs. I think the STe could do with a 'loadsacolour'
paint program and Photochrome is the standard to do it with. It's
a waste of potential, anyone agree? I still use Neochrome for rough outline
work, and Spectrum 512 to add a dash of colour/photo retouching but that
package is soooo slow and crashes on a MegaSTe (just press a key!) and
has sync problems and lots of other quirks... aaarrgh! I dream of a
modern-day Spectrum 512 using Photochrome.

Source record: 159878

If anyone out there has Chuckie Egg (of any edition) for the ST I would appreciate a copy, what you get back is entirely negotiable. I know it did exist, but it is severely ancient.

I don't care if it is a pirate copy, or if you blow me out for being a pirate. The company that produced it seem to have disappeared many years ago, and I can't find anyone to sell me a legitimate copy (though if you have one, mail me) so no one is losing out. Also, any other classic BBC games (games that appeared on both BBC and ST, rather than clones of the game type) would be much appreciated.

It should be possible to run Windows 3.0 in standard mode via SoftPC. You can't run Windows 3.1 or 3.11 because SoftPC does not supply any extended memory (even in simulated form), and Windows 3.1 and 3.11 require at least 200+k of extended memory to run.

3185. To TOS, or not to TOS

Newsgroup: comp.sys.atari.st
Date: 1995-08-31 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <424e3s$g2e@batph8.bnr.ca>
Source record: 159886

Since everyone on this group seems to be so fired up about piracy,
then here is a question for all the ethics experts out there:

I have a TOS.IMG file. I dumped this from my own MegaSTe. I use it for
my own personal enjoyment of STonX with my HP workstation here at work.
While some may argue that dumping my TOS was a violation of something, I
don't have a problem with it since this is for my own personal use.

Now, here is the question:

Someone with a different TOS (particularly a Falcon) has asked to "borrow"
my TOS image to use with STonX. I guess the thinking is that since the
person already owns an Atari computer, then that person should have access
to this TOS version, especially since it is a "lower" version that the one
being used in the Falcon.

My arguement would be that in spite of the above arguement, TOS 2.06 is
still being sold by third party vendors. Giving this person a TOS.IMG file
would be violating copyright laws and esentially taking money from the third
party vendors. After all, you are paying your $70 in part to buy the code,
as well as the EPROMS and the "labor" of burning them.

So, to summarize the question: would you give a TOS.IMG to this person?

Replies posted here would be greater appreciated by the public than a personal
email response.

I switched to the Newton so I have no use for my portfolio anymore.

It comes with 64 kb memory card, parallel interface and Folio Talk, a software to easily exchange information between ST/STE/TT and Portfolio. You can basically browse through the directorys of the Portfolio in a window as you could do with an external harddrive. The software to connect to the PC is also included.

I could throw in the German manual and a power supply for 220 V.
You could use the powersupply with a converter available in most travel and luggage stores everywere.

Offers please to my Email account

: if I can put another drive in beside or instead of, the 30.
: In case they used different types, how can I tell the difference
: in one type and another?

It's RLL. Most Megafile 30s use Segate ST225R mechanisms, though older models might house a Miniscribe. You could upgrade to a larger mechanism - I did, but in my case it requqired a new case (5.25" FH mech) and a new power supply (50W wasn't enough to drive it).

: By the way, thanks for the several answers to my TOS question.

3195. A man in need of VDI/AES bookies!

Newsgroup: comp.sys.atari.st
Date: 1995-08-31 00:00:00 UTC
From: udem148@bay.cc.kcl.ac.uk
Message-ID: <1995Aug31.182320.9515@alder.cc.kcl.ac.uk>
Source record: 159896

I have aquired Heat and Serve Sozobon quite a while back, and also used
a Graphics lib with basic functions compatible with Turbo C, which allows
my C progs to be easily portable between PC's and my ST.
However, since I needed to increase the fp precision to IEEE double 64 bit
catered for in SozobonX the graphics lib cannot be linked since it requires the
old fplib of H'n Serve (old Sozo fplib20) which allows only 32 bit fp.
I have still not got to grips with the basics of assembly coding and
so haven't found an quick and easy solution to the prob. The best option open
would be to use AES/VDI libs with the necessary graphics functions. However,
within the Sozobon Docs it points, for a complete description of AES/VDI
functions, to GEM: The Programmers Guide Vol 2: VDI interface + vol 3 for AES.

Anyone know where I could get my hands on this ?

Thanks much in advance.

I don't know of those two books: It may refer to the `Compute' GEM guides,
which are very good (lots of examples), but I think no longer available.

Probably your best bet is `The Atari Compendium' by Sanders, which has
lots of other extremely useful stuff in it, as well as AES & VDI (it's also
up to date on GDOS, etc.). In the UK, it should still be available from
HiSoft.

Both ST Applications and ST Review magazines ran series a while ago which
introduced the basics of GEM programming. You may be able to get back
copies. The ST Applications `Programmer's Forum' pages occasionally print
whole listings of simple GEM programs, which you should be able to pick up
a lot on.

On the net, there is the `Professional GEM' series of articles by Tim Oren.
They are good, but a little dated now. Available on atari.archive in a
number of different formats.

Failing all those, I have an extremely bad book, the Abacus GEM programmers
guide. I would give it away, except that it has so many typos and outright
mistakes in it, I wouldn't want anyone to learn GEM programming that way.

Doesn't software have to be written to be explicitly aware of the extra
memory? As far as I know, only a limited number of packages support it.

> I will be very grateful if someone can help me!

This is typical of a flow control problem. Make sure you have hardware
(RTS/CTS) flow control selected, and software (XON/XOFF) flow control turned
off. Also, check your modem manual, and make sure its default settings are
such that hardware flow control will work.

It is relatively easy to get and external zmodem package to work with Uniterm.
All you need are a couple of small macros.

VME vga card for ATARI MEGA STE???
How am I gonna do that, I allready have a card but it is ISA, are there other ways to fit it into my computer? And what about the software? NVDI et4000 or some shareware? Or is it really necessary that I buy the VME card and NVDI et4000 from ACN in Holland? That would be than about $300... a little expensive, than I'll better wait for the mighty ATARI MICROBOX wich has the best specifications I have ever seen!!!
And my memory, can I put normal 30 pins simms into the sockets or do I need to by simms "specialy" made for that computer. For the moment I have simms 4x1MB but I want to change them with 2x4MB can I just do that?

Hi,

What would all of you think of that, starting a new atari
shop in Belgium?
My computer dealer (ibm compatibles) and I are discussing it,
beacause we had a shop like that a while ago, but it is not
there anymore, so there are many people here who have an atari,
and there is also an atari club in our town. And I am very high
in atari, so reasons enough to do so, not?
Any comment is allways welcom!!!

Greetings, Jan Dooms.(jandooms@tornado.be)

When I said "bumper", I was being ironic. It was #4.25, although not far along the shelf was a somewhat more substantial PC Format with three cover disks and a #4.75 price tag (or was it #4.50?). I guess Future don't believe in cross-subsidisation.

T r a n q u i l

Welocme to Mnilu . .... Now at least Mnilu Tranquil ,GFA BASIC
'Compiler' is here for all you GFA BASIC coders. It's not the
official GFA compiler ,and nor can it replace the official compiler,
but it will enable everyone without a Compiler to turn their .BAS or .GFA
files into stand-alone .PRG files.

Mnilu Tranquil can be considerd the 'second' version of Mnilu.
It is by no mean the 'old' Mnilu with added support for GFA BASIC 3.5E,
but the GFA v2 compiler part has also had a _huge_ face lift.

Fully compitable with most GFA BASIC (v2 or v3.5e) files.

Mnilu Tranquil will soon be avaliable from the major Atari ftp-sites.
Or email to get back a UUEcoded version.

Please note that Mnilu Tranquil is postcardware.

3208. Give your IBM the Look and Feel of an Atari ST for $45!

Newsgroup: comp.sys.atari.st
Date: 1995-09-01 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DE7A4o.DGs@freenet.carleton.ca>
Source record: 159752

I have several complete copies of GEM version 3 (the last release
for IBM), together with a copy of GEM draw for sale for only $45
(all original/ licenced, with manuals, packaging, etc). This
software runs on any IBM compatible (XT up to a Pentium) and
gets along with any DOS above 3.1.

With GEM installed, you IBM suddenly takes-on the personality
of an Atari ST, but runs all of your favorite DOS programs from
a hassle-free desktop environment (one familiar to any ST Atari
user). You can format disks (even the 1.44 variety), run your
CD ROM, copy files, launch applications, etc. just as you would
on an ST (it even provides support for desktop accessories,
several of which are included in the package.

In addition to running all DOS applications (even those which can't
be run from within Windoze or DOS Shell, this software allows you
run dozens of IBM-native GEM applications (including recent
releases of Ventura; a DTP package rivaling Calamus, Page Streamer
Caligrapher, Payprus, etc.). The IBM GEM desktop can even be
loaded into high memory on 386 machines (using DOS 6.X's MEMMAKER)
so that GEM uses no conventional memory. GEM for IBM can even be run
in an IBM window (serving as a much better file manager than the
one supplied with Windoze). This capability means that you can
also multitask IBM-native GEM applications (GEM draw, Ventura, etc.)
along-side windows and DOS aplications, running concurrently).
one supplied with Windoze). This capability means that you can
also multitask IBM-native GEM applications (GEM draw, Ventura, etc.)
along-side windows and DOS aplications, running concurrently).

GEM was originally written in the earlier 1980's for IBM and was
subsequently recoded for the Atari (this explains the high common-
ality betwwen the Atari and IBM versions). In the IBM environment
it didn't get its break (due to the market advantages enjoyed by
Microsoft). However, newer versions of DOS have breathed new life
into GEM for IBM and this handy desktop seems to be just hitting its
stride, running today's much more powerful DOS applications and taking
advantage of the better memory management capablities of newer DOS
versions (GEM for IBM sits on top of DOS, just as GEM for the ST
sits on top of TOS).

No, GEM for IBM won't run ST applications (get the unrelated GEMULATOR
if you want to do that). GEM for IBM isn't emulating anything. Its
just running DOS and IBM-native applications from a much more user
friendly interface; in my opinion the best interface availible to
any IBM user.

Version 3 (dated 1990) will work with your VGA/ SVGA monitor and virtually any mouse you are using. I have only three copies of this excellent desktop (including GEM Draw and related desk accesory package) available for sale at $45. First come first served.

Hi,

Well, I decided I am going to setup a BBS with my MegaSTE with
version 2.05 of TOS, that has UUCP internet ability. Only thing is I
have the Atari HDX V5.0 program, which doesn't seem to recognize the
Seagate drive I put onto it.
(It came out of my Macintosh Q840AV).

My MegaSTE is a very capable machine and I still enjoy programming
it. So I want it to do something. :)

Does anyone know how to format, partition and install this 500MB
monster on my MegaSTE. I try the AHDI.PRG program, but it won't
acknowledge that a drive is there.

3213. v23INF4: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1995-09-01 00:00:00 UTC
From: avg@cwi.nl
Message-ID: <DE8A0s.FoF@cwi.nl>
Source record: 159757
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 23, Info 4

This article is posted twice a month. It gives a short introduction to comp.binaries.atari.st and describes how to submit binaries to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.binaries.atari.st

The moderated usenet group comp.binaries.atari.st contains publications or announcements of binary packages for Atari TOS computers. The publications on comp.binaries.atari.st may be freely distributed as long as no modifications are made to the packages. The packages may contain public domain software, shareware or demos of commercial programs.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.binaries.atari.st.

SUBMITTING BINARIES FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg. Note that comp.binaries.atari.st is not the correct place to ask general questions or to ask, "Does anyone have software that does X?" Post such requests to comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

If possible, submit your binaries in a Zoo 2.1 archive. I will generally check that everything in the archive is OK and that the files in the archive make sense on an ordinary Atari ST system (i.e. they are MS-DOS style files), unless the archive is specifically intended for use with an alternative file system such as Minixfs. If necessary, I will re-pack the binaries using Zoo 2.1.

If you are submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. But feel free to post demo versions. Submissions which I feel are of an excessively commercial nature will not be posted.

THE STRUCTURE OF COMP.BINARIES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "binaries". The binary postings are also called "Issues". The postings of type 'announcement' (history has only known 1) are no more supported, as we now have a group comp.sys.atari.announce for those. The type of a posting can be distinguished by the subject line:

Subject: v06INF1: Introduction to comp.binaries.atari.st

This first word in the title identifies this as the first info posting of volume six. Similarly, the subject line shown below:

Subject: v20i081 (binary): deadwrtr -- Ouija-word processor part01/01

identifies this as the 81st issue in Volume 20, and it's a binary posting. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v20i041 (binary): pet -- CBM PET emulator part04/39

The "References:" line, if present, points to the previous part of a multi- part program, so that newsreaders (trn, tin, nn, etc.) which can

follow threads will recognize a large program as a single thread.

The first few lines of an article's body are auxiliary headers that look like this:

```
Submitted-by: jackt@atari.com (Jack Tramiel)
Environment: high resolution, tt
Posting-number: Volume 19, Issue 80
Archive-name: rsn
Supersedes: atw: Volume 10, Issue 10-15
```

"Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site. This will usually be the same as the "From:" line in the article's main header.

Certain information about the system configuration required to use the program is given on the Environment: line.

```
Environment: 1meg, medium res, high res
```

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory. Examples:

```
high - runs in high resolution (monochrome)
medium - runs in medium resolution
low - runs in low resolution
1meg - needs 1 meg of RAM
ste - requires an STe
tt - requires a TT
```

The "Posting-number:" line repeats the volume/issue information for the aid of notes sites and automatic archiving programs.

The "Archive-name:" is the "official" name of this program in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

The "Supersedes:" header line, if present, indicates that the program replaces an earlier version.

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-by header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in
the posting (for instance, a font editor's documentation might refer to
some sample fonts), contact the submitter, not me. I post articles in
their entirety, so if it isn't posted, I probably don't have it.

HOW TO OBTAIN OLD ISSUES

There is currently no officially documented archive for this group.

3214. **** JDEB - Software announcement ****

Newsgroup: comp.sys.atari.st
Date: 1995-09-01 00:00:00 UTC
From: konjagr@eua.ericsson.se
Message-ID: <426m59$a21@euas20.eua.ericsson.se>
Source record: 159758

```
**************************************************************
* *
* S O F T W A R E A N N O U N C E M E N T *
* *
**************************************************************
```

I have now put the JDEB High Level (source) debugger on the net
at:

Location : ftp.uni-regensburg.de
Adress : 132.199.1.202
Directory : incoming (if they have'nt moved it by now)
File : jdeb_ok.lzh

Hints: Use the program tv56.prg (part of the package) to get
more knowledge of how to use JDEB. This is done by
simply unpack the package in some nice directory and
then drop the tv56.prg over the JDEB icon.

Put the WALLCHRT.TXT on your wall, so you don't have
to have the HELP window opened all the time.

Read the MANUAL.TXT at least once (helps a lot).

(Don't forget to put your ftp program in binary mode, as
I often do, hehe...)

Info: There will be a FAQ in this group (is there a better
one?) about JDEB.

Have fun/
Jan-Olof

: KW> Just trying to keep this thread going, as I'm sure there are a lot of
: KW>us who would love to get the English version.

: A few days ago I wrote a message to the devoloper. When I get response I will let you know, whether there is an english version or not.

I have just received version 3.04 of Junior Office. Translation work has now started on this, and should be available RSN. This is the official translation!

We had translated version 2.01, but many bugs seemed to appear in it... more on the new version later..

3220. ** FAQ on JDEB.LZH **

Newsgroup: comp.sys.atari.st
Date: 1995-09-01 00:00:00 UTC
From: konjagr@eua.ericsson.se
Message-ID: <426mma$a21@euas20.eua.ericsson.se>
Source record: 159764

```
FAQ for JDEB.LZH, the Lattice-C source debugger:
************************************************

-----------------------------------------------------------------------
> How well does it work in MultiTOS? With MemoryProtection ON?
>

The program(s) (Yes, you may have more than one programs loaded
at the same time) to debug becomes a part of the debugger itself,
so I guess the memory protection is no problem.

-----------------------------------------------------------------------

> Can I jump between source level and assembly-language level?
>

Of course. You may have as many source OR assembly windows
opened as you wish. Only limitation is the size of your
memory. In the assembly windows you may execute, single
step, watch variables,....e.t.c. the same way as in the
source windows. Variables will change content during execution
as well as the content of any memory-dump-window.

-----------------------------------------------------------------------

> How big is it? 100k? 200k? (I must pay for data transferred over
> the net, so this will be an important point)
>

The .LZH file is about 130k.

-----------------------------------------------------------------------

> How do I do to evalute expressions ?
>

Well just open the EXPRESSION box by hitting CTL-v and then type
in any C-expression. You may for instance type:

1 + 2*2.34 <ret>

or

mVar1 = 237 + (mVar2 & 0x01) - p_pointer <ret>

..this will change the value of 'mVar1' in your program, if that
variable is part of it.

-----------------------------------------------------------------------
```

3221. Lattice C v5.6, cheap sources ? & HSC update?

3222. v08INF7: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1995-09-01 00:00:00 UTC
From: avg@cwi.nl
Message-ID: <DE8A15.FpB@cwi.nl>
Source record: 159766
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 8, Info 7

This article is posted twice a month. It gives a short
introduction to comp.sources.atari.st and describes how to submit
sources or digressions to the group.

I am always looking for suggestions on how to improve the usefulness of
the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.sources.atari.st

The moderated usenet group comp.sources.atari.st contains publications
or announcements of sources and texts about programming for Atari TOS
computers. The publications on comp.sources.atari.st may be freely
distributed as long as modifications are documented and the original
authors are mentioned.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the
instructions below for submitting material intended for publication on
comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent
to avg@cwi.nl. If you are on a UUCP-only site, you can send them to
uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your
submission, or in a cover note. I try to verify that a program works,
and if I can't get it to work, I may hold up posting it for a couple of
days. Please note that, except in rare cases, software without
documentation will not be published. The backlog from receipt to posting
varies from one to four weeks depending mostly on the set of submissions
currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a

while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "sources". The source postings are also called "Issues". For a while, 'announcements' were also accepted, but there is now a dedicated group, comp.sys.atari.announce, for that purpose. The type of a posting can be distinguished by the subject line:

Subject: v02INF1: Introduction to comp.sources.atari.st

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

Subject: v06i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler

OSS - OSS Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
zoo-high - program is archived (Zoo 2.1 required to unpack)
lharc - program is archived (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 6, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

HOW TO OBTAIN OLD ISSUES

There is currently no officially documented archive for this group.

3223. Falcon + S/W for sale (US)

Newsgroup: comp.sys.atari.st
Date: 1995-09-01 00:00:00 UTC
From: renfro@bnr.ca
Message-ID: <4271b6$97j@bcrkh13.bnr.ca>
Source record: 159767

Atari Falcon030 with 4 Meg ram & 84 Meg HD.

Includes all the S/W that came with US Falcons
(Atari Works, D2D, AFM, etc.), VGA adaptor plug,
SC1224 adaptor plug, complete HiSoft BASIC 2
package (version before they added specific
Falcon support, but it does work fine as is),
and various other S/W downloaded from the Net.

I'll include a SCSI 2 cable for hook-up to
external SCSI devices.

Approx. 2 years old, in perfect condition.

Asking $750.00 USD including shipping.

I live in Richardson, Texas (north of Dallas).

Also for Sale:

Calamus SL (latest version) - $250.00 plus font editor & vector images
VIDI ST cart and s/w - $50.00 Video image digitizer
Migraph Hand Scanner plus
Touch-Up v1.69 - $85.00 plus scan & save, merge it s/w

All above come with original boxes and user manuals. Price includes shipping.

Send mail to R.HOEKSTRA1@genie.geis.com

RandyH

Ditto - I've heard that patches exist for upgrading current versions of GFA
- As I'm struggling to get 3.5EE working on all machines including the
Falcon this would be very useful. I did have version 3.6, but it was buggy -
Did they ever sort it? - All adds seem to be for 3.5 which I've already got.

Does anyone sell a decebt version of 3.6 or higher?

Any help - pointers to FTP directories etc greatly appreciated.

P.S. anyone wanting the 'best' Atari National Lottery Program - Mail me.

> diskversion of 1.04, the only TOS.IMG I could get hold of. And as
> noted earlier, DUMPTOS doesn't work. ;) (noone who has a tos.img for 2.04 to
> lend me or any other tos.img that works with STonX? ;) If so, you can upload
it
> to pinky2.itv.se)

STonX currently does not* work with TOS 1.4! 2.06 is the only version that is
suppost to work, other 2.x versions might* work, there is a very small chance
that 1.6 or 1.62 will work, but 1.4 will not* work! (and neather will 1.0 or
1.2)

Just wondering: Has anyone tried using that MagicROM program to make a MagiC
TOS.IMG to run with STonX? It would be really* cool...

> there another way to get data from Atari to Macintosh?

Apple File Exhange sucks! There is a better program called Apple PC Exhange. It lets you mount PC/Atari/Apple II ProDos directly onto the desktop! It should* have come with the sys7.5! Look in your System Folder:Control Panels folder for it. If its there, just stick an Atari disk in the drive, and its icon will pop right up on the desktop! Warning: be sure to only stick 720k or 1.44k disks in there, if you stick, say, an 820k disk in there, it will format it!!

But it'll cost you just #2.50 a month to subscribe and this deal gets you a second disk. Both glossy Atari mags seems to be readying themselves for the time when newsstand distribution ceases to be viable in the UK.

> No magazine can stay
> afloat for long with such feeble advertising revenues,

Just comparing the number of paid-for pages in AW and STF does not tell you anything about the advertising revenues of these magazines!

Hi Ari,

MacMiNT only supports MiNT/TOS not GEM. Most TOS-programms may be run.
MacMiNT implements some required TOS-routines and uses MiNT v0.95 (or v1.08).
It will be run as a Macintosh application.

For a perfect TOS/GEM emulation you should use the commercial MagiCMac
from Application Systems Heidelberg (ASH) (Germany). It is a port from the
Multitasking Atari-OS MagiC! developed by ASH which will be run the most
GEM- and TOS-programs.

address:
Application Systems Heidelberg Software GmbH
Postfach 102 646
D-69016 Heidelberg
- per Telefon: 06221 300002 (Mo.-Fr. 10.00-12.30 Uhr)
- per Telefax: 06221 300389
- per Mailbox: 06221 303671

MagiCMac costs 300 DM (-> $200).
If you are interested I can send you the latest Demoversion (v1.1) wich
include PowerPC support.

Greetings, Bernhard.

Tony Crowther is is name I think. He wrote numerous other games like Nightmare, Liberation (both of which are not a patch on Dungeon Master or Chaos Strikes Back IMO!) and Bombuzal. Fernandez may have been his handle, it does sound familiar...

I think he did speccy/amstrad stuff too early on... Amiga is his main platform though. (Liberation was CD32 for instance).

By the way, what happened to the CD32? :> What crap that was... Almost as badly advertised as the Jaguar!

STeno will do it with a GDOS font. Edhak will do it with a TOS font.
STeno is commercial, and Edhak is shareware. There should be demos of
both in the usual places. (atari.archive.umich.edu atari/ micros.hensa.ac.uk
pub/micros/atari/ ftp.uni.kl.de pub/atari/ ftp.cnam.fr pub/atari/)

Have a look in the /atari/Applications/ directory on atari-archive, there's
more than likely some non-disabled shareware program that does what you
want. I'm not sure if "Masterbrowse" runs as ACC but it it does, it'd
do what you want.

No, but I know there's an excellent package from Phil Burk called something
like Hierarchical Music Langauge, I'm sure it would be quite easy for you to
make an Atari ST version of it since it's already running fine on both Amiga
and Macintosh. I don't have his email but Mike Haas probably have and he
visits this group occasionally.

Message-ID: <wongck.260.000A084B@ti.com>
Source record: 159793
Body handling: Inline uuencoded payload not displayed: ROM_IMG.PRG

Hi guys,

Actually I had this for a long time (several years)... but didn't post it as
it may be illegal to dump your TOS. Anyway, saw someone post out their
version of tos dumper, so I guess it's OK.

This TOS dumper is done by someone else, I cannot claim credit for it (author
please stand up). I have tried it on my ex-MSTE TOS 2.05 and STFM TOS 1.02 &
2.06. But not tried for Falc (I don't own one). It's very small -- about 300
bytes and it's call rom_img.prg. Just double click on it, and it will create a
TOS.IMG file in your current folder. Here is the UUencode of it.

So now everyone can dump their own TOS IMG !!
Please remember the copyright law... don't come after me! If you think it
infringes the copyright law please don't decode it.

Source record: 159799

>system info programs report that I have TOS 1.062.
It's wrong. Try PROFILE 2 which is THE definitive system analyser.

There is no TOS 1.06.2 or 1.062. It is 1.62.

If you look at the OS at _sysbase offset 2 you'll see 2 hex digits 01 62.
In TOS 1.6 you'll see 01 06. THESE are the real TOS version numbers.

TOS 1.0, 1.2, 1.4, 1.6 and 1.62 were all known as that at first. Then TOS
2.01 and 3.01 came out.

Atari, in their wisdom, saw fit to rename all the earlier TOS versions in
accordance with the new nomenclature for TOS 2 and 3 and also to reflect what
the OS code in the ROM says.

So, they became TOS 1.00, 1.02, 1.04, 1.06 BUT TOS 1.62 had to remain 1.62.
There is no zero preceding the '62' in the OS. Adding a zero just makes it a
greater mockery than it has already become. The confusion is something else
which is evident from the posts here in the past week or so. We have Atari
and others needlessly fiddling with the numbers to thank for that.

For differences between the TOS versions I refer you and others here to The
Atari A to Z book from me.

I don't use the Mac, so I'm not sure. But I think that the Mac with 7.5
can read PC disks directly without the use of Apple File Exchange, and can
also format disks as PC disks.

The ST format for disks is almost compatible with the PC format, but not
quite. You should be able to read PC disks on the ST and write to them.
And there are plenty PD programs which format ST disks which are completely
compatible with PC.

:>
:>I tried it under Linux/m68k but it didn't work :(, but it could be because I
:>used the tos.img produced from my Falcon.

The Falcon TOS contains 68030 instructions and hence will not work with STonX, since STonX only emulates a 68000 CPU. STonX should run under MiNT/X with a TOS2.06 rom image. The next version of STonX will fix a few bugs in the 68000 emulator which should allow MiNT to run under STonX - thus you will be able to run MiNT under (stonx) MiNT.... and recurse infinitely.....

Atari is in immaculate condition with mainly games software and 2 joysticks.
Boxed. As a bonus I am including an Epson LX80 printer with printer cable
(although the printer has lost one cover panel on the top which is cosmetic
and doesn't affect its performance). 60 pounds for the lot.

>Ahem. MagiC does not need HSMODEM. MagiC's own TOS serial-port routines
>were written with help from the HSMODEM author. MagiC's TOS does not need
>such a patch.

I think what you say is true as far as MagiC 3.0 is concern. However, what I
have is MagiC 2.01, and the docs says that I don't need any serial patch prg
except that I may want to use HSModa. IIRC, it also states that the MagiC
developer is getting HSModa author help in their future release (Magic 3 ??).

So the question now is "Do I need HSModa patch for magiC 2.01??"
I hope not because all these stuff takes up memory (and I am already on 4 Meg).

I have almost exactly what you want (grin) - here it is:
1-1040STE with 4 meg/RAM, TOS 2.06, Atari mouse.....$250
1-SM124 Monitor (hi-rez mono).....$50
1-Link 1 SCSI _adaptor_ w/cable & software.....$50
1-Set of Notator/Creator disks & dongles - enough to run
two sequencers Notator & Creator at the same time!.....$150

You can buy all or part - but if you take the whole thing, I'll pay shipping
and throw in some extra goodies (grin).

> Hi,
>
> Has ANYONE in this newsgroup tested a ZIP Drive together with an
> Atari computer yet?

Hello Carl,

If I remember correctly, HiSoft don't have the drives until some time in
September - which should be very soon.
They won't sell the driver software separately however, so the only possibility
is to buy the complete package from them (if some smart shareware programmer
doesn't make drivers as well).
I don't know what would be necessary for making it work - in my eyes the ZIP
should behave like any removable disk in the SCSI chain, but I may be wrong.
The drive only responds to two SCSI unit numbers (don't know which ones, but
probably 0 and 1 or something like that), according to some info I got, so a
small adjustment of your current SCSI devices' unit numbers may be needed.

Have a nice day,

Claes

> whick the Link 1
> simply does not support. Please help!!!
> Thanks in advance.

Hi Paul,
It may be the parity that gives you problems, but it could also be that the Link 1 can't deal with all SCSI-II devices (I'm not sure). The ZIP is a SCSI-II only device and I don't think it works with a SCSI-I controller.
HiSoft has driver software, but they only sell it together with the drive -I don't know what is so special with the software, but it could be that it's necassary to be able to run the ZIP.
Maybe you could try with a Link 2 if you know anyone who has it?
Please tell me any progress - I'm very interested.

> Hi All!
>
> Does anybody know how much it is for a Sound Pool FA-8 interface for
> Cubase Audio. I would like to know the prices in Germany and UK.

Hello Lars,
In Germany the recommended price is DM698:- with the German MwST (VAT) included.

There is also a very interesting Swedish product available, called JAM8. It's priced at SKR3595:- (including Moms/VAT) here in Sweden and should be available from most Atari shops, for example Mr Data AB in Malmoe, tel +46 40 974400, fax +46 40 974060.

The JAM8 seems to be great, since it has eight 1/4 jacks out and 1-bit D/A converters with 18 bit resolution.
The outputs are electronically balanced for professional use.
If I didn't already have the FA-8 I'd get JAM8 instead - in my studio the +4dB is better suited than -10dB.

Frequency response: 10Hz-22kHz +- 0.1dB at 48kHz
Dynamic range: 93dB A-weighted
Harmonic distortion: 0.005%
Output unbalanced: 1.4V RMS
Output balanced: 2.8V RMS
Size: 129*47*134 mm

As an extra bonus, there is a low noise A/D converter in development for use together with the JAM8 (then you won't need the DAT to make professional recordings through the S/P dif interface). Release date for that little baby hasn't been announced yet, but I guess it'll be soon.

Have a nice day,

Claes

3268. Keyboard ST-compatible?

Newsgroup: comp.sys.atari.st
Date: 1995-09-02 00:00:00 UTC
From: Doug Finch <76337.1067@CompuServe.COM>
Message-ID: <429l0sngp1@mhadf.production.compuserve.com>
Source record: 159715

My niece recently inherited a Casio CTK-450 keyboard, and since I was in the process of giving her my old 520STfm (expanded to 2.5MB), can anyone tell me if the keyboard will interface with the Atari? Although there's no mention of MIDI capability in the operator's manual, the Casio has an output jack marked for "Phones/Output." Since by now you realize I'm a total newbie when it comes to music/MIDI on the ST, can someone tell me what I need to get these two guys to make beautiful music together? Thanks in advance for your help. DF

I'm thinking of having a go at setting up the Lynx browser software mentioned in issue 10 (Sept. '95) of .net magazine, p. 81.

Please would someone let me know which is the best Mint and Mintnet version to use (also the Lynx software, if it has any versions).

What is the best .Zoo depacker/uncompressor. (I've got one for .zip and .lzh, but, as it usually turns out, not the required one!). Or if possible the name of a multi-uncompressor which will do all standards.

Thanks.

> on 4 Meg).

you do need DRVIN.PRG and the relavant serial port driver in both Magic
2.0x and 3.00 I'm not sure about newer versions of Magic 3. With my
Magic 3.00, DRVIN loads then it loads in my case SCC.PRG but after DRVIN.PRG
is then freed from memory, its job is to hook in SCC.PRG into Magic.
With Magic 2.0x it stays and provides a couple of calls that this earlier
version of Magic does not provide.

Bye folks....

How do you eject the disk by software? Is "Install devices" enough for
mounting a newly inserted cartridge?
I remember reading it had only two choices of SCSI-id's. Does it work OK
if you already use 0,1,2 and put ZIP as 6 (Falcon manual recommends
successive numbering, and ICD-manual don't mention about it).

If you get ftpov (Faster than POV)-package from Hensa, you'll get also
a program called 3D2-POV.TTP, it does what you want.
It was converted from a PC-version by Douglas Little (APEX-programmer).
Bad (or good) news is that it's ported only to Atari Falcon030, TT030 &
other 68030+FPU based TOS machines.

Right enough. I was thinking that Mxalloc() would have to be used instead
of Malloc(), but the Atari Compendium says that Malloc() behaves according
to the program header flags.

>Having said all that - I did read that several well know pieces of

3284. BLITTER UPGRADE NOT WORK

Newsgroup: comp.sys.atari.st
Date: 1995-09-02 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <09021995.144011@empyr.dircon.co.uk>
Source record: 159731

Hi, I have recently been given a Blitter Chip, and I can't get it to work.

I have an 520 STFM (Rev 'D' board), with the following upgrades already installed:

Marpet XTRA-RAM Deluxe board with 4Mb on it.

TOS has been changed from 1.02 to 1.04 (Possibly 1.41 if such a version exists, as four of the TOS chips have 1.41 on them, the other two have 1.40)

Everything has been working fine up until I tried to install the Blitter.

I got the correct socket (at a price !) and soldered it to the board, the correct way around, NO dry joints / breaks / joins etc. I removed the solder from pads W3 and W4 (Blitter enable points) and installed the Blitter the correct way around (small dot pointing to the left, where pin 1 is marked on the PCB).

When I switch on, all I get is a black screen (hi res mono) and the power light on the ST. Nothing else. The floppy light does not come on and it won't boot at all.

If I remove the Blitter and reconnect the W3 and W4 solder pads, my ST works fine again.

Is there some strange incompatibility with Blitter Chips and TOS 1.04 ??

...or do I have a dead Blitter chip ?

The Blitter part number is: C101643-011, ATARI 1987, B004 38809.

Is there any way I can test it ? I have a variety of test gear, including a 20MHz oscilloscope, a good Digital meter with a zillion functions on it, but no logic probe.

PLEASE !!! Can ANYONE offer me any help on this ? It has taken me almost a month to track down the correct socket and now it all seems in vain.

MANY thanks in advance,

Kev.

: >I've asked Compo, but they're not saying.
: Compo seem unwilling to get to grips with Protext.

My gripe is their failure to come to grips. Such a great program ... pity.

To repeat, I'm running Protext 6.5 on a TT and also on a Mac
Powerbook 150 (030/b&w) via MagicMAc where it far outperforms anything
(and I've tried a few) on the Mac side.

That recent non-review of Protext 6.6 in Atari World was a large
letdown.

Also, what about the journal "Exfile"? I'm a subscriber and you,
I believe, are a contributor. Another pity to drop it as well.

Perhaps the sun will come out tomorrow. (Tho' likely not where
you live ;-))

> (MIDI out); (c) analyze or "listen" to my playing (MIDI in); etc...

Not for the ST, but for the PC: check out iForth. It comes with
MANX, which is a language extension for expressing music in
strict ASCII (for easy manipulation). The input/output layer can
be MIDI, but direct speaker I/O and mechanical means (relays)
are also supported.

MANX comes with fairly complete drivers for BOSS DS-330, CASIO
HT-700 and Roland JV-1080 (just started working on this one).
Incredible complex things can be done with it.

For more info: ftp to iaehv.iaehv.nl, directory pub/users/mhx,
or send me email.

Also check out the Formula package, it's for the ST.
Grab the user manual from ftp://bigbird.csd.scarolina.edu/pub/formula/
(info supplied by -b0b- <quasar@wco.com>)

Just get the latest of both. You can either get MiNT 1.12 or FreeMiNT
1.12.4. I can't seem to get FreeMiNT working well enough, but I'm told
that FreeMiNT has a number of bug fixes, so I guess you sould go for this.
I think net-072.tgz is the latest MiNTNet.
There is one version of Lynx at ftp.cnam.fr. One for 020 one for 68K.
Just get the proper one for your setup.

: What is the best .Zoo depacker/uncompressor. (I've got one for .zip and .lzh,
: but, as it usually turns out, not the required one!). Or if possible the name
: of a multi-uncompressor which will do all standards.

I do not recommend one of these "Multi" ones, as you'll have difficulty
operating it completely from a commandline.

You should find Zoo 2.1 somewhere, that's what I use. And you'll be stuck
without Tar and GZip.

Hope that helps

g>Seagate drive I put onto it.

WHen using the MSTE internal host adapter, you need to
- turn off parity on the disk drive
- set the drive to ID 0
- switch off termination on the drive (jumper or remove termination
resistors)

HDX should then work with the drive - otherwise, you could try the ICD Pro,
or SCSItool software.

>the time when newsstand distribution ceases to be viable in the UK.

That might still be a long way off (for one of them, at least) - I'm sure
I've seen Amstrad PCW and QL magazines on the shelves fairly recently, and
both those machines have a much smaller user base than the Atari series.

Anyway, I've never subscribed to a magazine in my life because I reserve the
right to flick through a particular issue on the shelves and decide it just
isn't worth the money. And I'd certainly feel like Mr Stupid's simple
country cousin if I committed myself to another 12 months of STF. (:

>>No magazine can stay afloat for long with such feeble advertising revenues,
>Just comparing the number of paid-for pages in AW and STF does not tell you
>anything about the advertising revenues of these magazines!

I suppose not, especially when STF supposedly charges significantly more for
the privilege. If the costs are as high as other posters have indicated, I
don't quite see how all these PD libraries and discount software houses can
afford it. It may be significant that most of what I would call the
"quality" advertisers have moved over to Atari World completely.

I am using it for my MEGA ST4 and for PC486 with UART 14650a
all the changes you will notice are made
by loading the f1 configuration (by at&f1) and writing the changes I
would like (eg. atx3 , at&w,...) so the only thing i have to do
opening my modem is : atz.
I have changed a lot of the configuration eg ats56=128 (I disable the
V.FC because I not have very good connections, ats10=255 because i
have a lot of lost connections...)
I found that the results of ati4 depends on the Configuration
Profile... that you can get by ati7
Here is mine configuration:

3295. Why wont these TTP's not run ?

Newsgroup: comp.sys.atari.st
Date: 1995-09-02 00:00:00 UTC
From: peters@damp.apana.org.au
Message-ID: <428m46$43u@frisbee.damp.apana.org.au>
Source record: 159742
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,frisbee.atari

Greetings fellow Atarians !

I have a problem with a couple of old (circa 1988) ttp programs. The problem being that they wont run.
The two programs are parts of an algorithmic music system called Ravel. When I first tried to run them they would not start. I ran them again under Kaosdesk (gives better feedback on problems) and this told me that the progs were not executable. I then ran Knife st to check the disk etc and then ran the prog again under Knife using the run other program option. Knife then told me that the prog had an invalid program load format.

Now how, apart from data corruption, could this happen ? Is it something to do with old tos versus new tos ? I am running an Ste with tos 1.6. I would have thought that there shouldnt really be any backwards compatibility problems between tos's ? I have tried just about everything to get it to work even dearchived the originals again just incase something went wrong on the download but to no avail. The original archive was a tar.Z but I wouldnt think that would make much difference.

Can anyone help me with this ? I would really like to get it all up and running.

Many thanks in anticipation of excellent replies (by E-mail pref).

Source record: 159744

Thanks, I finally found them (5 pins) well hidden under the drive,
and noticed that only 3 of the had resistors on the end. I decided
that these 3 must be the ones I was looking for and connected two of
them together. I managed to connect the wrong one to start with of
course and ended up with SCSI ID4 :-) Ooops. After a quick dismatle
again, I managed to set it to ID1, so I now have 100meg instead of 50.
Thanks for your help. I wasnt really expecting any replies!

Robert.

You don't really need it. But it's very good (and fast)
to have HSMODEM installed.

>I have HSModem installed but do I need the SerialFix program ?

HSMODEM fixes all problems and speeds the transfer up to maximum
possible speed. So if you use HSMODEM, then you DON'T need
any other serial fix program.

: I REITERATE: WHAT AM I DOING WRONG????

Have you got an /etc/resolv.conf? It looks something like:

```
domain domain.name
nameserver xx.xx.xx.xx
```

You can have more than one nameserver (and it's a good idea), but you can
only belong to one domain. You must put IP addresses in the nameserver,
because to resolve hostnames, you need a nameserver to resolve from!

: SO WHY DOESN'T ANYONE HAVE THE GUTS TO RESPOND TO MY QUESTIONS?

Lighten up, bobo. With an attitude like that, you won't get any answers.

: been his handle, it does sound familiar...

His alias was Ratt. As far as Captive and Knightmare go, I'm still
playing Captive. (I'm still absolutely amazed how he managed to fit so
many bloody levels on one single disk -- there just doesn't seem to be
any end! I'm on Mision 7, level 1, and I _know_ there are more than 20
missions - that's more than 220 levels! Even if each level is only 5k,
that's _still_ 1.1 megs -- and that's just for 20 levels; I know there
are more! Compressed, maybe he could get that down to
300k, add in the digital sound, the game, intro, etc. and it's still
pretty excellent coding. Pee Cee programmers could learn some o' that
sort of efficiency)
Anyway. Knightmare I quite liked. BOth games are pretty fast; Dungeon
Master had the atmosphere definitely, and the gameplay with those myriad
spells and whatnot, but I think it suffered a little from being too slow.

You could try downloading the MagicMac demo (an archie search should find one near you) and run that on your Mac. It will read Atari formatted disks and even though the demo only lasts a short time (15 minutes, I think) it's long enough to copy some files over for direct transfer to your Mac HD.

On the other hand, you could simply format a disk to Dos 720k on your ST, (there are a few utilities that will do this; Redformat and FCopy Pro are two that come to mind) and copy the files you want to transfer to it. If your Mac is running PC Exchange (doesn't it come with System 7.5?) it will happily read this disk as if it were a Dos formatted disk with no further effort on your part.

I have heard reports that formatting floppies to Dos 720k on the Mac and then using them on the ST will produce unreliable (at best!) results. However, I am able to perform this feat without a hitch, so I can't vouch for it.

cheers.

arch.

>I don't suppose it converts from the .WVE format as used on the Psion
>machines?

I don't know what WVE is, but it could be WaVE, which means WAV and
that one is supported by 525. Besides, most samples can be imported as
raw files. And the next version 2.11a will even be able to skip headers
at the beginning of raw files. that way it is possible to convert .sd
(sound designer) files, too.

3311. Beer Case Mouse Fix

Newsgroup: comp.sys.atari.st
Date: 1995-09-03 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DEC0G4.MrK@freenet.carleton.ca>
Source record: 159660

I've had nearly a dozen different new and used STs over the years and have worn out several mice. Perhaps it is my Scottish extraction which has kept me from pitching out these dead rodents when their time had come.

Recently, I pull three out of my junk box. I wanted to figure out what it takes to fix an Atari mouse. All three exibited same problem; the left mouse button moved and clicked, but failed to do anything useful.

I popped open the case of the first and found that pushing on the microswitch itself (the yellow rubbery protrusion on the circuitboard inside the mouse) allowed me to launch programs, etc. as normal. This indicated that the problem with this first mouse was that the external mouse button no longer had enough travel to operate the microswitch below. I carefully removed enough material from the mouse housing and from the appropriate surface of the external mouse button itself to allow this first mouse to point and click like new.

Dead mouse two and three proved to have the same problem as no. 1.

However, these were resurrected by an even easier, more eloquent means. I decided that instead of increasing the button travel, I only needed to raise the circuit board inside the mouse by a few hundreds of an inch. This was accomplished by shimming the forward end of the board up with a single piece of cardboard cut from the top of a beer twelve pack (cereal box cardboard may work for you more clean living types). When you install the shim, be sure that you put it right on top of the shoulder which is molded into the mouse housing. If you put it into the airspace recess under the circuit board, it will be out-of-play and won't do anthing.

I now have three working mice for my trouble. Hope that this fix helps you to overcome the most common mouse malady!

I've heard that an NEC Multisync monitor can delivery
output all three ST resolutions when properly connected.

Is there anyone out there who can tell me how this is
done? In particular, I'd be interested in knowing how
one comes up with the right cable (do you make it or
can they be bought. If you make it, where do you get
the necessary supplies (particularly the ST end of the
cable). How does one get sound?

on a separate matter, I have a freind with an SC1435
monitor, but no interface cable. Can the cable be
bought anywhere? If best has them, does anyone have
their Phone, fax or e-mail no.?

Many thanks for any info you can provide!!

>Please tell me any progress - I'm very interested.
Sadly, although I was assured by HiSoft that it would work ok with the Link 1
(as I had problems with my CD Rom), it did not work and eventually they admitted
I need a Link 2 which will arrive on Monday so I'll tell you how I do.
HiSoft' software is not yet ready and wll be released in Mid/Late September. As
far as I know it does not actaualy drive the ZIP(this is done by the ICD
software) but simply allows you to write protect, password protect, eject &
format your disks. I'll tell you what the software is like as soon as I get it..

3315. >>> I Need Help <<<

Newsgroup: comp.sys.atari.st
Date: 1995-09-03 00:00:00 UTC
From: gbutler@hic.net
Message-ID: <42bdca$io3@news.hic.net>
Source record: 159664

I got started in computers with the Atari ST.
Gave it to my little brother when I got my first
386SX. I've sinced moved on to bigger and
better stuff. Now I have several Pentium
machines and I have become a very literate
computer user. Started with DOS and then
did the Windoze thingey.

Got another Atari1040ST the other day for
basically nothing. Want to use it for one
particular piece of MIDI software that I used
to use a bunch.

My problem is the SH204 that came with it.
It don't seem to work. Unlike my old SH204,
this one's light just comes on and stays on.
What's the deal. Is the HD screwed up?
How can I go about using another type of
HD for the ST?

I used to have everything that was worth
having for this series of computer. The funny
thing is that I've totally forgotten how to use this
machine. AUTO folders....forgot all about that.
Desk accessories.....nuther thing I forgot about.

Please help me if you can....thanks...

Meg Lee Chin O'Leary <egg@yolk.demon.co.uk> wrote:
>Does anybody know how to do the clock modification to the falcon in
>order to stabilize the running for Cubase Audio?

What does "stabilize the running" mean? If you have timing problems,
your hard disk is propably too slow (with a good a/v drive there are
no timing problems at all). If your stereo audio gets distorted
sometimes ("reset devices" fixes that!), it's a bug in some Falcon's
that Steinberg has not been abnle to find yet (DSP rounding error).
If you get audio clicks when using FDI and "Offline"'s Tapepitch or
Sample Rate Convert -functions, it's because FDI is put on top of
your Falcon's disk drive and things get too hot (put FDI on the table
and you don't have clicks any more)...

Clock modification should fix only distortion problems when playing
very long audio files. You can find instructions from:
ftp.mcc.ac.uk dir pub/cubase/incoming or pub/cubase/MISC,
or from any Atari-repairshop (it needs accurate soldering!).

3319. Towers 2 help

Newsgroup: comp.sys.atari.st
Date: 1995-09-03 00:00:00 UTC
From: smoore@chowgar.demon.co.uk
Message-ID: <810152208_OASIS_@chowgar.demon.co.uk>
Source record: 159668

Has anybody managed to get very far in this game yet, when it first came out a couple of months ago there was loads of talk about it but none for quite some time.

I'm stuck on a part where there are loads of teleporters and each one takes you backwards and forwards between rooms with wierd little grey monsters. They look a bit like standing up snakes with large flat heads and they are extremely hard to kill. I managed to open a secret door and drop through a hole where there was a bloke who told me he would tell me how to free the sword from the stone if I gave him something but when I levitated back up through the hole I was killed by one of those damn grey things.

Can anybody help?

Cheers.

It was too "samey" for me. I got bored by about mission 4 or thereabouts...
Find the little things, pop some dynamite in them, run like buggery...

> 300k, add in the digital sound, the game, intro, etc. and it's still
> pretty excellent coding. Pee Cee programmers could learn some o' that
> sort of efficiency)

Graphics are 16 colour, PC are 256. This immediately doubles the ammount of
K needed for graphics.
Sound is generaly 16-bit, not 8. So this doubles the K for the sound...
It goes on! :)

> Anyway. Knightmare I quite liked. BOth games are pretty fast; Dungeon
> Master had the atmosphere definitely, and the gameplay with those myriad

: If I remove the Blitter and reconnect the W3 and W4 solder pads, my ST
: works fine again.

: Is there some strange incompatibility with Blitter Chips and TOS 1.04 ??

: ...or do I have a dead Blitter chip ?

I have nearly exactly the same set-up as you describe, the only
exception being that my Atari was originally a 1040 STFM, and the
blitter/TOS 1.04 work just fine. So assuming you got all the solder
off W3/W4, I'm afraid it looks like a duff chip to me.

: The Blitter part number is: C101643-011, ATARI 1987, B004 38809.

My blitter chip is marked S8830 MM9092Y and was supplied by Paul Rossiter.

Have you checked the continuity from the actual pins on the chip thru
to the tracks on both sides of the PCB? You might have a bad connection
in the socket or a bad plated-through hole. Happens sometimes.

regards.

B> 1.62. There is no zero preceding the '62' in the OS.

You're close, but your history needs a little brushing up on. It was TOS 1.62 that caused history to be rewritten, not TOS 2.01 and 3.01.

What's amazing is Atari claimed, for example, that TOS 1,04 was _always_ 1.04, even though their own Rainbow TOS docs repeatedly referred to it as 1.4.

And who but a moron would make a very minor update to a v1.06 and call it v1.62??? For that matter, who would use v1.02, v1.04, v1.06, etc., in the first place?

This was all done to explain away the way the TOS version is stored and read in the ROMs, and it was all brought about when TOS 1.62 came out and started confusing programs that read the TOS version the old way.

Hello there,
If my memory doesn't fail me, I think that the internal SCSI-interface (if it's Atari's own interface) could only handle one SCSI-device!?!?!?
If you have the internal SCSI interface you'll need to get a Link II or another interface that connects to the DMA-port to be able to handle more devices.
Check out if it's possible to switch off the parity on the drive -the problem could lie there. Most interfaces can't handle hard disks if the parity check is switched on. Link II doesn't care so any hard disks should work with it. Make sure that the devices come in order - if the unit numbers aren't in order 0-1-2-3..., AHDI doesn't search for them.

Good luck and best regards,

Claes

] September - which should be very soon.

What has HiSoft got to do with ZIP Drives? Very little I hope.

There are ICD Drivers for them, and for most practical purposes, they work
on Ataris in the same fashion as a normal removable-media hard-drive
type device.

3328. Q: Broken SM124

Newsgroup: comp.sys.atari.st
Date: 1995-09-03 00:00:00 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <42dbuf$gdh@golem.wcc.govt.nz>
Source record: 159677

I got an SM124 monochrome monitor for my STe the other day, and although it worked for a while, it has now packed up. (It was free so I can't complain too much). The problem is this. I turn on everything as usual, all seems to work, except that there is very little white on the monitor, only the pixels immediately to the right of where black pixels are show up as white. The rest of the screen is black. This is what it _looks_ like anyway. It _is_ usable, but difficult to read text, and all the "colors" are wrong. The sound works. I've also tried it on an STFM, and same problem, so it's a pretty good bet it's not the computer.

I notice that using it on the STe, whenever the hard-disk or floppy is accessed, the flicker on the SM124 worsens until it stops accessing. Even when it is displaying white space, there are a lot of flickering vertical lines on the monitor. The SC1224 I'm using now works fine, but the monochrome doesn't want to go. I tried adjusting the internal brightness and vertical setup things, but they didn't help.

Basically, what should be white on the screen is black, and what should be black, is also black, although some bits of white do appear, enough to make text etc. barely readable. There is also a ~3 pixel stripe on the left hand side of the screen which is pure white....

Is the tube stuffed? Or is this one of the common problems with these monitors, that hopefully a not-terrible-great repair-person like myself might fix? (i.e., no delicate soldering).

Any help would be good, as the Spectre-GCR isn't too pleasant in color mode....

So you are Computer literate,

Pardon for the smart remark, but it truly does not sound like that is the case.

First, if you get something for nothing it is problably for a good reason, fact that the light stays on means it is hooked up wrong or it is just plain broken, so get it FIXED.

Second, the Auto folder realy is not that much different from the Auto exec for the DOS boxes, it is only a lot easier to work with.

So the deal is, you came back to a good computer and forgot how easy it is to run it after running Windoze.

3330. QUANTUM HD WARM UP ????

Newsgroup: comp.sys.atari.st

From: kevan@empyr.dircon.co.uk
Message-ID: <09031995.121732@empyr.dircon.co.uk>
Source record: 159679

Hi, I have got a Quantum LPS105S 105Mb SCSI-2 drive connected to my AdSCSI+ host adaptor. When I first switch my system on, I get 'MSense $FE 0,0' errors quite often. It will sometimes just bypass several auto folder programs and just launch Ease Desktop which is the application selected to autorun in XBOOT.

For the first 10 minutes or so If I try to run any applications, I frequently get 'Data may be damaged on Drive (n)' errors and 'MSense $FE' errors.

After it has 'warmed up' the problems disappear.

The Quantum also makes periodic TCU's (Thermal Compensation Updates, or 'chk chk chk' noises) which I have gathered are quite normal, but these also disappear once the unit has been on for about 20 minutes.

I have recently added a Seagate ST125N 20Mb SCSI drive to the chain, as ID 1, and so far, this has not given any similar problems, although I do not boot from this drive.

Has anyone ever heard of hard drives needing to 'warm up' before they will function correctly before ?

I do not have the docs for the ICDPro drivers I am using, just the handbook for the AdSCSI+ and there is no mention of a 'MSense' error. I have seen 'Sense' errors before on my old and now totally dead Rodime, but never 'Msense'.

Anyone got any ideas ?

Many thanks in advance.

Kev.

Hi Doug,

> My niece recently inherited a Casio CTK-450 keyboard, and since I
> was in the process of giving her my old 520STfm (expanded to
> 2.5MB), can anyone tell me if the keyboard will interface with the
> Atari? Although there's no mention of MIDI capability in the
> operator's manual, the Casio has an output jack marked for
> "Phones/Output."

Sorry, no way! "Phones/Output" is the output jack that should be connected to earphones or possibly a HiFi system.

A MIDI plug has a 5-pole DIN connector for each direction: MIDI in and MIDI out, just like those on the left side of your Atari.

> Since by now you realize I'm a total newbie when it comes to music/MIDI
> on the ST, can someone tell me what I need to get these two guys to make
> beautiful music together?

Well, you've got the right computer for making music, that's for sure!

My advice is that you shop around for a another keyboard instrument: one *with* MIDI plugs. Shouldn't be too expensive, especially if you find something second hand.

You then need a MIDI sequencing program to feed your Atari with. For an easy start I'd recommend *Sweet Sixteen.* I'm not sure if that one is available where you live, but either you shop around for a similar program, or I'll ship you a copy of Sweet Sixteen - the programmmer happens to be a friend of mine. Price is approx 80 USD.

Remember, you don't need the newest, fanciest stuff to enjoy music making!

Best regards

As far as I know, there's nothing special a driver has to do for ZIP drives.
There are SCSI-Tool/HuSHI users using ZIP drives, without us having ever done
anything special for these drives.

Hi,

PS>How do you eject the disk by software?

Hard Ship. It's simply the head ship option. But you don't need it, it has an eject button...

PS>Is "Install devices" enough for mounting a newly inserted cartridge?

It's like any other hd with changeable media, the media change usually is detected by the system automatically, but may be forced by hitting ESC

PS>I remember reading it had only two choices of SCSI-id's. Does it work
PS>OK if you already use 0,1,2 and put ZIP as 6

Yes, of course.

PS>(Falcon manual recommends successive numbering,

that's bullshit. ;-)

PS>and ICD-manual don't mention about it).

It doesn't matter at all. Use SCSI-IDs freely if just running with your falcon...

CU,

Gerrit

Try the Link 2 using ICD Pro or HD Driver....

If you can get a second hand one try getting an ICD SCSI 2 adaptor board as
I've found these the most reliable.

3339. Help with Space Quest

Newsgroup: comp.sys.atari.st
Date: 1995-09-03 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <95246.235735STIRRE31@MAINE.MAINE.EDU>
Source record: 159688

I have gotten stuck again in Space Quest. I have reached the settlement
(Ulena Flats?) via the skimmer but am perplexed on what to do next.
I can get points through drinking and hearing the story of the Deltaur
and by buying the droid but how do I arrange transportation? Any help
would be very much appreciated! Thanks in advance.

We can only take legal action against you if the claims you make against
L.A.P.D. are false. If you speak the truth you have nothing to worry about. So
go on say what you wish and if it's true fair enough, if it's not then you'll
make our day.....

> I find it more than easy to believe LAPD do not make a profit and this
> worries me. They have so many adverts that I can not understand how on earth
> they even begin to cover costs

LAPD is run as a hobby by two dedicated Atari fans. It isn't expected
to make a profit. Why should you worry about us covering costs?

> ... this is why they treat compilers so badly.

Actually, L.A.P.D. do have compilation disks in the library. Legal
ones ... and the compilers have never complained.

> The big libraries would rather supply stuff on 3 disks rather than on
> 1 and so they loose money. And so they make up stories about people leaving
> docs and important info out of the compils. Admitedly this used to happen
> often but now it is frowned upon by the whole PD community and many people
> will simply (and rightly) refuse to spread it.

My God, just what are we dealing with here? He says we make up stories
about people leaving douments and important info out of compilations then, in
the very next sentence he says 'admittedly this used to happen often'. If he
accepts it used to happen then we're not making it up are we? He then says
that 'many people will simply (and rightly) refuse to spread it'. But that's
exactly what we are doing ... simply and rightly refusing to spread it. So
just what the hell is he complaining about?
If he's saying that the situation has improved and that compilers
are more responsible then prove it. As for the two libraries that he mentions
as giving good value a check through the catalogue of at least one of them
will reveal areas were compilation disks have been removed for copyright
reasons, i.e. they were distributing pirate software on compilation disks.
It's sad if he thinks that is good value. Some of the pirate titles that have
appeared on compilations have been our licenceware disks. At peak times we have
paid in excess of 1,000 uk pounds per quarter to our licenceware authors thus

giving them a return for their efforts and encouraging them to produce more first class programs. The blatant ripping off of those programs by compilers and the uncaring distribution by other less reputable libraries takes income from the authors. I can't see it stopping until some form of legal action is taken and it may come down to us to be the ones to do that.

Lastly, consider that when L.A.P.D. and the other companies that support the ST finally stop advertising the ST magazines will disappear and the ST scene will die, so don't knock it.

[about ANSI colors]
Just configure CoNnect right! I don't know the right word in english,
but start CoNnect and open the setup-dialog. The third point (in German
"Darstellung", I guess in english "view"?) allows you to activate the
colors. Then CoNnect works in the way you like it. The default is that
CoNnect works only monochrome......

That's Ok. But never use your Atari and your workstation at the same time.
You've only the right to use TOS 2.06 once at the same time! If you want
to use it on different computer at the same time you have to pay for it.

>Now, here is the question:
>
>Someone with a different TOS (particularly a Falcon) has asked to "borrow"

Yes, I have one.

>How am I gonna do that, I allready have a card but it is ISA, are

Check out the Nova cards. These are in fact ISA-bus cards with a VME to ISA bus converter. So install converter into VME slot, and an ISA graphics card on the other end. My VGA card has one meg on board RAM at address $c00000, and I/O addresses for the card begin at $d00000. The NOVA cards are made by "Computer Insel" in Germany. I don't have their address, but if anybody else on the group has it and posts it on the group, contact them and they might send you just the converter alone.

>And my memory, can I put normal 30 pins simms into the sockets
>or do I need to by simms "specialy" made for that computer. For
>the moment I have simms 4x1MB but I want to change them with
>2x4MB can I just do that?

AFAIK, the simm slots only take 256k, 512k and 1M simms. More RAM would need to be added to the VME bus. I don't have the VME specifications, but theoretically, you should be able to "split" the VME bus and have two cards in parallell as long as they have different addresses. Check for RAM boards for VME bus. Anyone know if these exist? I'd be interested in these, too.

TOS 1.2 was "Blitter TOS", 1.4 was "Rainbow TOS". (could someone tell me why*
its called Rainbow TOS?) Your TOS version shoulden't be a problem.

It looks to me like you have a serial mouse. Get a DB-9 to DB-25 adaptor, plug
it into the serial port, and find yourself one of those serial mouse drivers.

Well, it looks like the archive is all okay, brilliant, thanks again! :)

What is the most stable/working version of System 6.0.x for use with
Spectre. I seem to recall it being 6.0.5 is this correct? If I can't
get that, would 6.0.8 be a good second choice? (A friend of mine
works for a company that sells mac's so he's having a hunt around for
me, to see if he can find any system disks that old ;-)

Thanks again!

3362. Various TT problems: HD floppy & blitter

Newsgroup: comp.sys.atari.st
Date: 1995-09-04 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <42fnp1$1cs@gti.gti.net>
Source record: 159606
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a TT that's acting up in several annoying ways.

First, the floppy isn't working correctly. The machine was originally TOS 3.05, but was upgraded to a WinX patched version of German 3.06, and has the upgraded floppy controller chip (AJAX?). I can read high-density floppies created on my Falcon, but cannot read double-density (720k) floppyies created on the same machine. Nor can I even format floppies at all. Running Profiler 2.4 tells me that drive A: is a high-density floppy.

I tried to install a new drive mech. to test it out, but the system doesn't even recognize that a floppy exists with this new mech. I know the drive mech. works fine, since I also use it on my 486 system. When I power the TT on (with the new drive mech. in), the drive light glows real sickly (weak). When I try to access A:, I get "drive A: does not exist". Is there any thing I should be aware of when replacing the mech? I noticed some jumpers on both the old and new, but they don't match. Even when I matched them up, it still doesn't work.

Also when running Profiler 2.4, it tells me that there is no blitter installed in the system. I thought these were stock on TT's? I didn't see any empty sockets when I opened the machine, so hopefully this doesn't mean that I have a bad blitter!

Finally, does anyone know of a way I can get hold of a English (american) TOS 3.06? Call me a purist or anal retentive but I like to have things like this as original as possible.

3364. Tos for STonX

Newsgroup: comp.sys.atari.st
Date: 1995-09-04 00:00:00 UTC
From: Kev <kahmadi@cs.strath.ac.uk>
Message-ID: <42eihf$3o6@dunlop.cs.strath.ac.uk>
Source record: 159608

I have been trying to get a tos.img file for using with STonX and have run into difficulties.

I have tried using the MON program that comes with Lattice C V5.6 on both my Falcon (TOS v4.01) and my STE (TOS v1.6? I think).

When I am running it from my Falcon's hard disk there is no problem, it saves the tos to file and everything is fine. But if I run it from floppy on the Falcon it produces an error message (ERROR 50).

On the STE, which has no hard disk, it simply locks up and leaves a file with the correct name but zero length.

At first I thought it was a disk space problem but this does not seem to be the case.

It has been said that the Falcon tos is no use for STonX, so can someone please tell me what I am doing wrong with the STE. I have tried both versions of MON (68000 & 68030).

Thanks in advance

Kev.

Gotta' be a PC/Amiga shop somewhere in Melbourne OZ (local services/
shop phone catalogues should indicate), that sells the 'Eclipse' mouse which
has been out for ages and is sold in practically most computer
software/hardware shops here in the UK.

> than differing speeds?)

There are I have discovered, several types of WAV file, though the differences
are mainly cosmetic changers in the header and won't affect the sound data.

However, the RIFF-WAVE specification does support storing the sound data
in formats other than PCM (Pulse Code Modulation - the "normal" method),
i.e. A-law or Mu-law forms, or as compressed PCM.

The most likely thing is that these are compressed PCM WAVs - not many
Atari products support them, the only one I can think off offhand that
does is Atari's System Audio Manager - no use to you if you don't have a
Falcon.

Music Studio is a simple, kid-oriented sequencer, which does not require a
MIDI keyboard. Chordex shows chord patterns on keyboard and guitar, the
chords are selectible among major, minor, diminished and seventh, sixth,
and ninth. Both are for colour only. I obtained Chordex through Suzy Bee
Software in New York state (Toad has their CD ROM) or you could look in
ST Informer for the address of Suzy.

One of the beauties of Atari is that small size drives are still of
some use. I have a 20 Meg Supra which has all my MIDI programs,
sample files and VIDI programs. I also have a Megafile 30 which I use
for DTP, because it's too damn noisy for music! Sounds like a helicopter
landing on the roof! It's the fan that does it. I reduced the noise
by clipping off the grill pieces, allowing the air to exhaust more
freely.

JUNIOR OFFICE V3 (ENGLISH!)

I now have version 3 in my possession, and I have had a good look round it. I have not yet translated any of it but it should be a fairly simple task (if a bit long-winded!)

There appear to be no new features over the old version, but the following improvements are immediately apparent:

1) Vastly improved speed
2) Vastly improved stability (it hasn't crashed or failed yet!)
3) Improved User Interface (much more intuitive)
4) 4 Fax Drivers are included as standard so all Fax-modems should be suitable

Nope.. IIRC The unregistered version ONLY runs as an .ACC It is not selectable
because it should only be called by another program (e.g. CoNnect, Uniterm etc.)
and is not designed to be selected.

In 1991 I made a cassette album of algorithmic music on the Atari ST.
I used Mitch Bradley's Forthmacs and an extension package called FORMULA
(Forth Music Language). I found the package to be extremely versatile, and
recommend it highly to anyone interested in algorithmic composition.

One of the most interesting aspects was the ability to interact with the
composition as it is playing. For example, I created several "musician"
processes, each with its own style and instrument assignment. These
entities were taking their cues from a global variable that contained
the current chord. I could change that chord from the Forth terminal
while the music was playing, thus influencing the musical decisions
that the processes were making.

I have yet to find another musical computer language that approaces the
flexibility of the Forthmacs/FORMULA package.

Hi,

I am currently on the Internet using a PC, but I have recently acquired a Falcon and would love to use the Falcon in order to download some Falcon Software and specifically, information about modifying the clock rate chip in the Falcon for Cubase Audio Applications. I've received a lot of good advice as to where I can get the specs for this modification but unfortunately I can't view these files on my PC! Now.... does anybody know where I can get Internet software for my Falcon? I'll probably need to order it via snail mail, seeing as I can't figure out how to log on to Demon. They tell me they have no Falcon software available on disk.

Thanks a lot.

I'd sure like to get out of where I'm stuck in Knighmare! I'd like to hear from anyone who could help me out here.

I'm stuck in a spot where there is a large room with floor buttons. Each button you step on keys a fireball. I have one key which opens a door at the end of a short hallway at the exit end of this fireball room. I open the door to find another door, with a large smiling moon on it.

When I open this door, those little short guys come at me with a vengeance and I keep getting killed. Does anyone know how to get out of this situation??? I've been stuck there for way too long.

Hello Simon,

I can't help you because I'm stuck at the same spot I believe.

There are three connecting rooms here, right? Teleporters are in the center
room, and the room with with smaller antechamber.

I've not found the drop through door. Where the heck is that? I've not been
able to kill one of those little whorlwinds either. I'm thiking of
walling them in.

How did you get the teleport spell? I don't have it. I've got
"heal" 'hammer' 'Wall of fire' 'food' 'Make wall'.

I'm still working on it, so let's keep in touch and try to work through
this game if you don't mind?

>>> "Exit" let it exit by itself when mail etc has been fetched. How?

p> unless someone can write a TSR that checks incoming text for a specific
p> set of text and then sends 'EXIT<CR>' out of the modem port.

I use PPP and have the following line in STARTUP.NOS

"PPP sl0 idle 300 exit"

This means that if the link is inactive for 5 mins then exit. This also
means that some SNMP station pinging you _could_ keep the link up. :(
You could also use the "AT" command. This can cause you to to exit from NOS
at a specific time or at now + specific time elapse period.
This is all unusable to me as I run a patched serial port and find that NOS
leaves the serial port unusable. If I exit and re-run Semper all is ok.
Dows anyone have a program to reinitialise the serial port?

Forgive me if I'm wrong but I always thought that TT's were never designed with the Blitter in mind. Their unique video subsystem design and the 68030@32 Mhz was supposed to negate the need for the extra hardware...

There's actually a PD program called "Blitter Simulator" that will mimic the blitter in the handful of programs that actually call it.

Ari

Fair enough. The story I heard was that it was a original 68000 not the 68010 - and that the extra hardware in question was not the MMU you mention below (I was aware of this), but something to get around the non restartability of some of the 68000's instructions.

Something along the lines of making sure it was always executing a 'dummy' instruction when a page swap was needed - so that the failed instruction could just be chucked away. I have no real idea how this (was supposed to have) worked.

> The MMU _designed_for_ the 68010 was known as the 68451. This was a

Dear all,

A friend of mine (who is completely computer illeterate) has wiped her only copy of PROTEXT. She has 10Mb of files created with this prog. and doesn't really want the hassle of learning a new text editor and loading her old protext files into it.

Does ANYONE know:-

a) The author's name, address, telephone or e-mail?

b) A software archive or BBS where I can get it (i.e. by post in Atari format - I can only get onto the Internet or BBS's using PC's and my friend does not have one of those DOS recognising disks).

c) If it's still publicly available, and if so will it recognise the old file format?

Failing all that, could someone post me ST Format disk #41, which, I'm told has the old copy of Protext on it.

Many many AtDhVaAnNkCsE,

> disks and a #4.75 price tag (or was it #4.50?). I guess Future don't
> believe in cross-subsidisation.

(The following is based on information I recieved aeons ago. It may not
still be appropriate today, though, but I put it forward for discussion)

Actually, it appear that they do.

If one assumes that each disc is fixed at one pound in price (disc media,
labels, duplication costs, "attaching it to the cover" and so forth), then
the disc-less price of STF is 3.25. Divide this by 80 pages or so, and you
get four pennies per page.

Applying the same rules to the PCF mag, 4.75 less three pounds for three
discs at one pound per disc leaves 1.75. At 4p per page, if PCF is 44
pages or more (44 pages times four pennies per page equals 1.76), then the
price per page of PCF is being subsidised by the <higher> STF price per
page.

If they were truly charging the same price-per-page for all of their mags,
with discs priced at one pound each, then the PC mag would need to be
priced higher. (Or, if the PC mag is truly representative of the price per
page, then STF should reduce in price). Otherwise there is some cross
subsidisation going on.

I believe that the cost to print one page does not differ violently
according to what is put on it (as long as one is comparing like with like
i.e. comparing A4 glossy to A4 glossy)

Of course, they may also point to the fact that STF sells perhps one copy
for every ten copies of PCF sold. thereby meaning the cost per mag is
less. Or that <PC mag competitor> sells for the same price, so they can
not afford to price themselves higher.

(Or reduce the price of STF to the same price-per-page ad PCF. Yeah,
right. Like they'd do that sort of thing. But we can dream).

Another reason for the (relative) cheapness of PCF might be that the demo
versions of "commercial software" so prevalent on magazines today are mass
produced by the company promoting the software "featured" on the PCF disc.

Therefore the only cost to Future in this case would be mounting it on the cover.

Perhaps someone from Future Publishing would care to comment.

All AFAIK and IMO.

(Sorry. This post probably belongs in advocacy)

] a ship and droid and am now confronted with the Deltaur. How do I
] board the ship? I think I may need a jet pack but where can I find it?
] Thanks for any help!

Try to find the "Games Domain" WWW site. Its search engine will find
complete solutions to virtually every game around. I think
http://webcrawler.com would be a good site to use to find the Games Domain,
otherwise, just whatever searcher you'd use. (Of course, this is assuming
you have Lynx/WWW access :)

If it was SQ3, LSL1, 2 or 3, or Police Quest, then I could help you :)

h> Am getting a 1040fm set up for a friend to do midi notation...
h> There is a thing called an ICD box... and other odd solutions...

...the DMA-SCSI host adaptor. ICD are probably the most common but Supra did one which had no probs. You ought to be able to find a used one (ICD or Supra) for about 40 ukp (say $60). You will also need a 5v/12v power supply rated at about 30w or above. One out of an old PC will do and will have the right connectors hanging off it.

h> I suppose they all need odd low-level formatting software too...

ICD s/w tends to want to run against ICD host adapters only. The Supra stuff and Atari stuff doesn't seem to care what h/a it has. The standard s/w can be found on BBS or from the person you buy the h/a from.

h> Atari newbie....

Don't worry, it's all pretty simple stuff.

Message-ID: <42gfth$r58@newsbf02.news.aol.com>
Source record: 159646

To everyone who has offered me advice over the last week(s). My problem has been solved by exchanging the Sportster for a Zoom V.34X 28.8 modem which has worked flawlessly since I hooked it up. And I didn't even have to mess with the settings from the factory. Whewww... I'm tired of all those AT commands.

Several folks have mentioned that USR had let go of a bunch of the 28.8k Sportsters that had a bug which caused some weird problems with the higher data rates. But when calling USR's tech-line, the operator rudely informed me that there were no problems with the modem, just with my software/hardware combination. Whatever... USRobotics has forever lost me as a client. They suck as far as I'm concerned.

btw, the Zoom was even a few dollars less! :)

I cannot get Chimera or DUFTP to work!!
First of all, every time I try to move Chimera around on the screen,
it jumps over to the right edge of the display, leaving me looking at
a few pixels of scroll bar. Also, any time I try to link to any document,
Chimera gives me a "cannot open html::<document name>" message.

WHAT AM I DOING WRONG????

I have a good PPP connection to the net, and I can use FTP.TTP to connect
to a site IF I GIVE THE IP ADDRESS, but if I give the name of the site,
no dice.

Also, DUFTP does not want to connect to any site I give it. It cannot locate
the site.

I suspect that my DNS is set up incorrectly, but have no idea how to set it
up. I have it pointed to the name server on my Internet host, but it does
not seem to want to look up the names.

I REITERATE: WHAT AM I DOING WRONG????

I have repeatedly posted these questions to all the pertainant
COMP.SYS.ATARI groups, with no help. COME ON PEOPLE, LET'S STICK TOGETHER!
I have answered other peoples questions to the best of my ability. I
know there are some people out there who are using Chimera successfully.
SO WHY DOESN'T ANYONE HAVE THE GUTS TO RESPOND TO MY QUESTIONS?
Any advice would be appreciated!

I'd really like to get on the Web, and I'd really like to to it on a
machine that does not have to have a personal blessing from Bill Gates
to boot, but with this level of non-support, even a long-time Atarian
like myself gets a little frustrated. And every one of us that leaves
hurts the community.

COME ON, SOMEBODY ANSWER ME!

3409. PC Mouse?

Newsgroup: comp.sys.atari.st
Date: 1995-09-04 00:00:00 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <42dg14$h2b@golem.wcc.govt.nz>
Source record: 159700

I've seen this asked before, but I don't recall any definitive yes/no answer, with info if possible.

I have a PC Mouse, switchable between being a serial bus mouse, and a microsoft mouse. It uses the standard 9-pin D plug connection, and by messing around with a multimeter & the standard Atari mouse, I got this:

Atari mouse: (Looking at plug, NOT socket!)

X 2 3 4 5
6 7 8 9

PC Mouse: X = Unconnected Pin

1 X 3 4 X
X X 8 X

Line of wiring on ST mouse PCB: (Buttons on left) 6 9 2 3 7 5 4 8

Pins as used on the ST Mouse (From User Manual)

1 Not Connected
2 Right (Blue)
3 Left (Green)
4 Down (Orange)
5 Up (Brown)
6 Right Button (White)
7 Ground (Black)
8 +5V DC (Red)
9 Left Button (Yellow)

Obviously, as far as the ST is concerned, the PC mouse is only using the pings for Left, Down, and +5V DC. Presumably Left is the X value and Down is the Y value for the PC version, and pin 1 is used to send the signal for which button(s) are being pressed.

It doesn't _look_ as if it'd be easy to make a PC mouse work on the ST going by this information, although the basic circuitry appears almost identical, it is obviously transmitting different information to the machine. Can anyone confirm/deny this?

I gave my original ST mouse a good clean, and using NVDI's mouse accelerator, it's still quite usable. But I wouldn't mind having this other one to play around with. It doesn't say what resolution it is, and the spacing & number of gaps etc. in the light-detector rollers looks about the same as the ST one, so there's probably not a lot of difference...

All else failling, I can salvage it and experiment with it on the spare
ST mouse I've got :)

Source record: 159504

How far has anyone gone in upgrading a plain vanilla Atari ST ?

I would love to hear of some 'Monster STs' in existence !

Not that I stand a chance of holding the title of
'Monster ST of C.S.Atari', but I'll start the ball rolling with my current
setup:

Started off as: Atari 520 STFM, TOS 1.02, 0.5Mb RAM, bugger all else.

Current upgrades: 4Mb RAM on Marpet board, TOS 1.04, Blitter Chip, Mono &
Color monitors, 105Mb and 20Mb SCSI-2 hard drives,
AdSCSI+ host adaptor with real time clock, 9600 baud
modem and Audio Out from monitor socket going to Stereo
Amplifier. Plus Maxtor 800Mb optical SCSI WORM drive
waiting to be connected as soon as I can get the media !

So....come on, I'm SURE there are much higher spec STs out there !!!

Let's hear from you ! (..and be HONEST ;-)...also only equipment you
already own can be counted. (I was going to say *already connected*, but
then that would have excluded my WORM drive ! ;-))))

Kev.

3414. CANCEL: BLITTER PROBLEM !

Newsgroup: comp.sys.atari.st
Date: 1995-09-05 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <09051995.211402@empyr.dircon.co.uk>
Source record: 159505

Hi,

Further to my plea for help in getting my Blitter upgrade to work, there is now no need for any assistance...it works !

The problem was an intermittent connection on my Marpet XTRA-RAM board which just happened to go away when I removed the Blitter after thinking the Blitter was bad.

I have seen a few of these Marpet Boards go funny, especially the solder joints, they seem to oxidize and leave salt residues. Anyone else had similar experieces with them ?

RIght, now I am fully Blitterised, erm...what improvements am I supposed to be seeing ? So far, the only difference I can see is a small increase in performace of the Gem Draw routines, and then I only discovered that by running QuickIndex !

I was rather hoping it would provide a similar performance increase as NVDI has already done to my system.

Thanks to everyone who replied.

Cheers,

Kev.

writes in area 'COMP.SYS.ATARI.ST':
> Anyone have an opinion on the best hard drive for Cubase Audio?
> Ideally speaking, something fast reliable and inexpensive would get
> my vote..

Hello there,
I use one Conner CFP1060S (1GB) and one Conner CFP2105S (2.1GB) in my recording studio and both work like a dream. Conner are reliable and pretty cheap, so they should suit you fine. There is no meaning in getting expensive A/V drives. I've never understood the meaning of those - they were originally made by the companies that had calibrating hard drives, in order to be able to record without interruptions. I have a friend who works with big hard disk towers for PC servers and he told me that if a customer wants the A/V type of drive, they only change a ROM on the interface PCB on the hard drive (and charge a little extra), the drive mechanics and the rest of the electronics are exactly the same in both drives.
It's somewhat like the parity bit in SIMM's - on PC's you've always had to use SIMM's with parity before, but now the manufacturers of motherboards have discovered something revolutionary - the parity check isn't necessary at all and they've stopped using it (Atari machines have never had any use of the parity check - they've worked for years without it and finally, PC's have started to get a little closer to the truth).
Some brands of hard disks, like Conner, have never (to my knowledge) had these idiotic calibrating drives - their drives are reliable even if they are the standard type. I believe that Seagate have some good, cheap drives too - but I haven't tested them, so I'm not sure.
The most important is that the drive you get can read at least 1.2MB/s and that it has an average seek rate at a maximum of 11ms and that it never calibrates. Most modern 1GB drives can handle these requirements.

Have a nice day,

Claes

> something wrong ...

Hello Chris,
You aren't doing anything wrong - AHDI needs successive numbering to be able to find all connected SCSI devices, don't believe anything else.
I've had an old version of AHDI that didn't need it, but that one doesn't work on the Falcon. Some other drivers, like SCSI-tools or ICD might handle devices that aren't successive numbered (I haven't tried because I want an easy-to-check-for-troubles setup). Also beware of faulty termination -the termination should be on the last unit on the cable and nowhere else.

Best regards,

Claes

Hello Steve,
I would suspect that your problem is a bad soldering somewhere on the main board of the monitor - I've fixed several with similar problems. I can't tell you exactly where because it has always been different. If you can't fix it by re-soldering the PCB, it could be a bad capacitor somewhere, but that's much more difficult to locate.

Good luck,

Claes

Yup. Get GHOSTLINK which works over a null modem cable with the PC. You actually see your PC filestore on the ST in the normal GEM window and can manipulate it in the normal way.

GHOSTLINK should be on any half-decent BBS.

ST> Nope.. IIRC The unregistered version ONLY runs as an .ACC

No, the unregistered version runs as a PRG, but is limited to something like
80k for downloads, does not keep a log, and has a nuisance alert at the end of
each transfer.

TT> TOS 1.06 (or 1.6, if you will) is/was STe specific. 1.062 (1.62) was
TT> released in order to remedy a number of bugs in the original release.

Yeah, that number was two: The PoolFix bug and the STE_FIX (aka med res
DESKTOP.INF) bug.

Also, it's 1.62, not 1.062. Even Atari, with their penchant for rewriting
history, has never called it 1.062.

: TOS 1.2 was "Blitter TOS", 1.4 was "Rainbow TOS". (could someone tell me why*
: its called Rainbow TOS?) Your TOS version shoulden't be a problem.

It was called "Rainbow TOS" because the Atari logo in the info panel
was multi-coloured with a shifting rainbow effect.

Hi Chris,

CG>My mileage varied; I found AHDI would only recognise drives that were
CG>consecutively numbered starting from zero ... but maybe I was doing
CG>something wrong ...

No, that's right. But AHDI itself _is_ bullshit in that point ;-)
Try some other AHDI-compatible drivers.
(Why the heck is AHDI aborting searching drives, for the TOS searches _any_
drive for booting up?)

Does anyone know of a TOS.IMG booter? I know there's GEMRAM, but that just loads a copy of TOS into RAM, which then modified by an autofolder program. I want something that will boot a TOS.IMG file directly off a disk. That way I can hack TOS with a ResEditor, etc...

There is a program called Ghostlink that allows serial networking between DOS
boxen and ST's. I belive the DOS side of this works in the background under
Windont... (or is SIO2DOS the one that works in the backround...)

No blitter in a TT at all. The machine is too fast for the standard ATARI
blitter AFAIK. Just add NVDI if you want a little more speed.

:-)

that .... L> I'm thinking of having a go at setting up the Lynx browser software
L> mentioned in issue 10 (Sept. '95) of .net magazine, p. 81.

excellent choice !

L> Please would someone let me know which is the best Mint and Mintnet
L> version to use (also the Lynx software, if it has any versions).

MinT 1.12h2 I find is the best ATM.because I use MultiTOS and later versions
are not working with GEM very well.Mintnet archive 072 is latest.

If you have a TT or Falcon get the 030 version of Lynx which is great , don't
know about running it on a ST .
L> What is the best .Zoo depacker/uncompressor. (I've got one for .zip
L> and .lzh, but, as it usually turns out, not the required one!). Or
L> if possible the name of a multi-uncompressor which will do all

There is a ZOO packer available but there is also one included with DCExtract.

> something to do
> with old tos versus new tos ? I am running an Ste with tos 1.6. I would
> have
> thought that there shouldnt really be any backwards compatibility
> problems between tos's ? I have tried just about everything to get it

Hello Peter,
Sadly, there have been LOTS of compatibility problems between TOS versions, so
I'd say that's the most probable cause.
The programs would probably work on an older machine with TOS 1.0, 1.02 or
1.04, but that's no help to your current situation.
Dou you really need this program or could there be another one that does the
same thing? You could maybe check for upgrades on some BBS's or
Shareware-libraries (if the program is PD/SW).

Good luck,

Claes

>> order to stabilize the running for Cubase Audio?
>
> What does "stabilize the running" mean? If you have timing problems,
> your hard disk is propably too slow (with a good a/v drive there are
> no timing problems at all).

An A/V-drive is NOT necessary! They were a couple of years ago, because 'normal' drives weren't fast enough, but today almost any 1GB SCSI hard drive handles the data fast enough for audio recording. I run with no problems at all on one Conner CFP1060S and one Conner CFP2105S and they both work perfectly in my studio - both with 8 and 16 audio tracks. Read more in my little 'guide' to Cubase problems below.

> If you get audio clicks when using FDI and "Offline"'s Tapepitch or
> Sample Rate Convert -functions, it's because FDI is put on top of
> your Falcon's disk drive and things get too hot (put FDI on the table
> and you don't have clicks any more)...

Audio clicks is a very well known problem when the CPU clock isn't stable, and a modification has to be done. If clicks occour when the hints in my little 'guide' have been followed there has to be something else wrong with your hardware. The Falcon doesn't get hot in the area around the disk drive, so I don't think that the FDI gets too hot by standing over the drive -in fact, it was meant to be put there...
Read on...

++

Problems with clicks in your recordings with Cubase Audio for Falcon?

After fax exchanges with Atari in the Netherlands, discussions with the Swedish distributor of Cubase - Fitzpatrick Import Group, other cunning persons and various experiments of my own, I can now, with great certainty, say that I have all the facts to make shure there is never another click in the recordings.

* The CPU clock has to be modified because the clock pulses aren't clean enough and Cubase Audio is very sensitive to flaws in the hardware (any little error and the program won't work properly, it seems). Two different modifications are provided but regretfully there is no way of telling which one to do - if the first one doesn't work, the other one will. Always start with modification number one. The Falcon machines that are delivered at present are said to be modified from the start.

* When using HDX/AHDI a maximum of 256MB partitions is allowed on the hard disk or it won't work as it should. When using SCSItools from Hard&Soft it also works fine with partitions up to 511.9 MB. When partitioning in SCSItools the Sector size has to be adjusted to 8192 bytes and the Partition size to a maximum of 65532 sectors (I don't know why I wasn't able to go up to 512 MB, but 511.9 worked fine). In HDX these parameters can't be adjusted - partitions of more than 256 MB automatically get a Sector size of 16384 bytes, which doesn't work at all with Cubase Audio -the program simply says that it's impossible to record on the drive. I can also tell you that with a Conner 1 GB, I get a transfer of 1.3 MB/s with AHDI and 1.8 MB/s with SCSItools (SCSItools gives me a transfer rate with my 850 MB Conner EIDE of almost 3 MB/s !!!). For some strange reason, Atari have limited the SCSI-II port to 2 MB/s, but it's enough to be able to make audio recordings, so don't worry.

* A fast hard drive is essential, as well as a NON CALIBRATING drive. If the drive calibrates during playback or recording everything stops, since Cubase can't access the drive fast enough to maintain the data flow, so it's impossible to work with a calibrating hard drive. To run 8 tracks from the hard drive it seems that a seek rate of around 11ms is a maximum (most 1 GB drives manage this). It's possible to use slower drives as well, if the recordings are located on different drives (different PHYSICAL hard drives, not only different partitions). Another possibility is to use the RAM-tracks to get some load off the drive - that is, if enough RAM is available (I recommend 16 MB RAM).

* DEFRAGMENT!!! If the hard drive is fragmented (which it will become if you erase, clip and record over again), the playback / recording gets slower, since the drive heads have to seek over larger areas to get the recordings together - compared to what it is like when the recordings lie in a nice, long unbroken file. If recordings have been made to a fragmented drive and clicks have occured because of this, there is only one way of getting it right - make a new recording. I strongly advice everyone to buy Diamond Edge from HiSoft - it's the best defragmentation program that I know of and the one I use. Also note that slower hard disks are more sensitive to fragrentation than the faster ones.

* Always update the program (at the moment it's version 2.03). Cubase Audio gets updated all the time, with some small improvements and some bug fixes. With a program as advanced as Cubase Audio, it's always best to have the latest version.

If these steps are taken, there doesn't remain any possibility of getting clicks in the recordings. The last point is not of importance for the click problem since it's caused by circumstances outside of the program, but it's always best to have the latest one.

The clock modification should be covered by the warranty (it is here in Sweden, anyway) and made by your service center. However, if the warranty has run out you can do the modification yourself (DON'T if you aren't very experienced with a soldering pen and surface mounted components - I've seen terrible examples of soldering and if you're not 200% certain that you can do it, DON'T). I can send the schematics for these modifications if you request it by sending a mail to me (address below).
In most cases it's best to disable all software hard disk caches, since

Cubase handles the reading/writing in it's own way and extra caches may
interfere with the main program.

SCSI drives I have tested myself are:
Conner CFP1060S (1.06GB), Conner CFP1080S (1.08GB), Conner CFP2107S (2.1GB),
Conner CFP2105S (2.1GB), Seagate ST31200 (1GB) (the Seagate is much slower than
the others - about 400kB/s slower - but seem to work). The CFP1080S has
problems with timestretching, but the regular recording works fine. I hope that
I'll get the opportunity to test some more hard disks soon, and if they turn
out right I'll add them to the list.

I use one CFP1060S and one CFP2105S in my recording studio.

Good luck and best regards,

Claes Holmerup, service engineer at Micro Rescource Data AB in Malmoe, Sweden
(as well as Cubase Audio user).

++

I hope this can help everyone with Cubase Audio problems.

Best regards,

Claes

Hi *

In <42fnp1$1cs@gti.gti.net>, azog (azog@gti.gti.net) wrote:
: I have a TT that's acting up in several annoying ways.

: First, the floppy isn't working correctly. The machine was originally
: TOS 3.05, but was upgraded to a WinX patched version of German 3.06,
: and has the upgraded floppy controller chip (AJAX?). I can read
: high-density floppies created on my Falcon, but cannot read double-
: density (720k) floppyies created on the same machine. Nor can I even
: format floppies at all. Running Profiler 2.4 tells me that drive A:
: is a high-density floppy.
: I tried to install a new drive mech. to test it out, but the system
: doesn't even recognize that a floppy exists with this new mech. I know
: the drive mech. works fine, since I also use it on my 486 system. When
: I power the TT on (with the new drive mech. in), the drive light glows
: real sickly (weak). When I try to access A:, I get "drive A: does not
: exist". Is there any thing I should be aware of when replacing the
: mech? I noticed some jumpers on both the old and new, but they don't
: match. Even when I matched them up, it still doesn't work.
All PC disk drives has to be jumpered (?) as drive 1 (one). You do this
choosing Drive Select 1 (one) with the jumpers.
The Atari needs drives that react as drive 0 (zero). So you have to chance
the jumper in the drive you got from your PC.
I'm not sure ybout it, but I can imagine that the floppy controller needs
the information if there's a DD disk inserted. You may reach this setting
the right jumper in the disk drive.

: Also when running Profiler 2.4, it tells me that there is no blitter
: installed in the system. I thought these were stock on TT's? I didn't
: see any empty sockets when I opened the machine, so hopefully this
: doesn't mean that I have a bad blitter!
The TT has _NO_ Blitter. Due to the new Video System and the higher clock
rate on the bus the blitter would _slow down_ the speed.
BTW: TOS 3.06 still supports the blitter. You may see this when you use a
68030-Card with TOS 3.06 in you ST.

: Finally, does anyone know of a way I can get hold of a English (american)
: TOS 3.06? Call me a purist or anal retentive but I like to have things
: like this as original as possible.
No idea. Sorry.

Hope it helps.

You need to change the jumpers to select `drive 0'.

Also check that pin 1 on your 34 way cable is connected to pin 1 on the
drive.

What is the drive model number?

>Also when running Profiler 2.4, it tells me that there is no blitter

There is no blitter in the TT.

>Finally, does anyone know of a way I can get hold of a English (american)

I don't want to sound nasty, especially since I am asking for help, and
you were kind enough to reply. But you apperently didn't read my entire
post, or missed the point:

The floppy can read previously formatted HD floppies, so the switch
on the main board is set properly, and also implies that the cable is
connected properly. You don't know me, but these are the things that
I would normally check before posting for help...

I was able to make some progress with it today. There are a series of
jumpers on the drive, and I just took each position and noted the
behaviour. I was able to get it to operate in the reverse manner!
Prior, I could read HD flops, but not DD. Now I can read DD but not
HD! Odd thing is, now I can *format* HD flops, even tho I can't read
them afterwards. Still can't format DD flops...

I am thinking of just putting the old controller chip back in the machine
and dealing with it. This is a bummer, tho...

:
: What is the drive model number?

The original drive, which I have a feeling may be bad, is a Teac FD-235HF.
The drive I am trying to work with is Mitsumi D359T3.

From: dzander@solaria.sol.net
Message-ID: <42gpla$42g@solaria.sol.net>
Source record: 159573

Hi Atarians,

I am a little confused about high speed modems and the serial fixes
required for telecommunications. First, I own a 520 wt TOS 1.00 and
a Supra 14.4K modem. I get 340-360 bytes/sec on xmodem crc downloads.
Shouldn't I get something like 1/10th the baud rate? Shouldn't I be
getting about 1440 bytes/sec thouroughput? I tried to install the
program HSMODA06.lzh and I used the MFP.PRG with default settings.
(Am I supposed to install DRVIN.PRG after GDOS.PRG? then install MFP.PRG?)
Then I also tried to install the program serialfix.lzh. My question is;
do I need both of these programs or just HSMODA06 ? Also, how come I'm
not seeing any significant improvement? I only get 340bytes/sec? This
is frustrating. Thanks to anyone for any help.

Normaly it does. However, there is a program AHDIconfig, which can change
the AHDI configuration and make it scan EXACTLY the drives you want scanned.
You need AHDI>3.0 to support this set-up, however.

: read my mail? If so, how do I get my mail, do I have to nfsmount
: the mail directory on my server? etc

I think you first need to get the mail into /usr/spool/mail/<user> on your machine, then GEMMail can be used to look at it, post mail (sort of a shell to sendmail) and to move messages around. Rather like Elm or Pine, but GEM from what I can make out. Looks like an excellent idea.

Karl Foley (kfoley@cnserv.dungeon.com) wrote:
: In MiNT-Net is it possible to have a completion domain like NOS?

: I'd like to just type post, news, ftp, etc. And get post.dungeon.com,
: news.dungeon.com, etc.
: Anyone please?

I have my domain name in my /etc/resolv.conf. Yours should look something
like :

```
domain dungeon.com
search dungeon.com .
nameserver x.y.z.a # Whatever
nameserver x.y.z.b # Whatever
```

When you type `telnet host', the resolver routine will append the domains in
the search list. For example :

```
$ftp ftp
Connected to ftp.dungeon.com
```

J

PS. I can't remember if you need the domain line when there is a search line
in resolv.conf.

3462. PC BUS mouse to Atari Mouse - Instructions

Newsgroup: comp.sys.atari.st
Date: 1995-09-05 00:00:00 UTC
From: mparrott@kendaco.telebyte.com
Message-ID: <42h7ks$5e9@news.telebyte.com>
Source record: 159581

Enough people have asked that I've assembled some instructions for modifying a Microsoft Mouse (Bus Version Only!) to work with an Atari ST/STE/TT/Falcon. I have only tested this with the Microsoft Mouse II, but it should work with any mouse/trakball designed for a bus interface card on a PC. Included are general instructions for modifying the PC Bus mouse itself and for building an interface box which will allow any PC Bus mouse/trakball to be connected to an Atari ST/STE/TT/Falcon without further modification. Any particulars mentioned herein can easily be modified to fit whatever situation you may find yourself in - at least with respect to making a PC Bus mouse work on your Atari.

First, a NOTE: I am not in any way, shape or form responsible for any harm that may come to you, your computer, your mouse or other controller device, or anything whatsoever, through your use of the information contained in this file. While I believe all of the information to be accurate, I make no guarantees as to its accuracy and have no guarantee that you will perform everything in a safe manner or according the instructions provided. So you're on you're own here; however, it did work for me.

STUFF YOU MIGHT NEED FOR THIS PROJECT:

(items with "+" are for building the box)
(and may not be needed if you plan to)
(modify the bus device directly)

- Bus Mouse/Trakball + Electronics Project Box

+ Coffee, tea, soda, milk, water, beer, hard liquor, Everclear or whatever liquid refreshment/stimulant you feel necessary to continue

- Atari Mouse Cord (recommended) -OR- joystick cord with all 9 wires -OR- nine-wire conductor and DB-9 connector

- Solder & Soldering Iron + Hot Glue Gun & glue sticks

- Ohmmeter/Multimeter + Drill

- No. 1 Philips and Slot screwdrivers

+ Aspirin or Non-aspirin pain reliever (just in case)

ON WITH THE SHOW

Here are the pin and signal assignments for the PC Bus mouse and Atari mouse connectors:

```
Bus Mouse Signal Atari Mouse
--------- ------ -----------
1 Ground 8
2 Rt Btn 9 (Right Button)
3 -- -
4 -- -
5 LftBtn 6 (Left Button)
6 YA 3 (Vertical Cursor)
7 YB 4
8 XA 1 (Horizontal Cursor)
9 XB 2
10 +5v DC 7
```

Note that, as it pertains to this modification, pin 5 is not used on the Atari connector, pin 3 does not exist on the Bus connector, and pin 4 on the Bus connector is not used.

Looking in from the business end of the connectors (i.e., the part that normally plugs into the computer), the pins are labeled as follows for the purposes of this mod (this may or may not match any standard numbering conventions):

```
Bus Mouse Atari Mouse
--------- -----------

/-----\
--------- -------------
/ 4 2 1 \ \ 5 4 3 2 1 /
| 8 7 6 5 | \ 9 8 7 6 /
\ 10 9 / ---------
---------
```

Note the blank area at the top of the "Bus Mouse" figure. This is a "key" of sorts to prevent improper insertion of the plug, and is a handy way to differentiate between a Bus plug and a PS/2 plug, both of which are round. Another way to tell the two apart is the Bus configuration has ten places for pins, while the PS/2 configuration has only 6 pins. YOU MUST USE A BUS MOUSE/TRAKBALL FOR THIS PROJECT TO WORK. Serial, PS/2 and MousePort mice do not have the proper signals to work with the Atari mouse port.

```
BEFORE GETTING STARTED:
-----------------------
```

There's several ways this mod can be done, and you'll want to prepare for each a little differently. The first step, of course, to read over all the instructions carefully and make sure you understand them before proceeding.

Obviously, the mouse/trakball has to plug into the Atari. The best way to do this is to use the cord from an unused Atari mouse. The second best way is to use a DB-9 connector, which can be attached directly to the cord of the bus mouse, or to an un-used Atari mouse cord which can then be patched to the bus mouse. Note that the mouse cord MUST HAVE

ALL CONDUCTORS AVAILABLE with the exception of pin 5. Not all mice use the same number of conductors, and many have simply left the unused conductors out of the cord. You must use a cord which has the required conductors (1-4, 6-9) available for use. Joystick cables with the required conductors will also work, but are not as flexible as mouse cords; the same is true of most other cables you might make up yourself.

To simplify things later on, you might go ahead and determine which wire in the cable(s) are connected to which pins. Each wire should be a different color, which makes it easy to create a table listing each wire color and the pin it goes to. If the wires are all the same color, simply label each wire with a piece of tape and the number of the pin it connects with. You can get this information either by opening up the body of the PC Bus mouse and using an ohmmeter to trace continuity; checking things out visually, or by using a very small divining rod and immense faith in your ability to use it.

TO MODIFY THE BUS MOUSE/TRAKBALL DIRECTLY:

Using whatever 9-pin connector/cable combination you have chosen to use, simply connect the pins/wires from the Bus mouse connector to the Atari mouse connector as described in the chart at the beginning of this text.

If you will be cutting the connector off of the Bus mouse cord and replacing it with an Atari/DB-9 connector, make sure you have already generated a listing of what color wires go to what pins! Otherwise you'll be hard pressed to tell which wires go where and may never get it working right.

Once the connections have been made, check all of them and if all looks well, plug it in and give it a go. Make sure to check out all functions of the mouse (cursor up/down/left/right, left/right buttons). If it doesn't work properly, refer to TROUBLESHOOTING below for some tips. If it does work, congratualtions!

TO BUILD A BUS MOUSE/TRAKBALL INTERFACE

If you have an un-used IBM bus card handy, it can be used to construct a plug-in box which will allow the use of any other bus controller (i.e., mice, trakballs or pen mice) without having to perform further modifications to equipment. The Microsoft Bus mouse comes with an 8-bit ISA Bus card; if the PC Bus mouse you obtained did not come with a card and you do not have another, you might try obtaining just the 10-pin Bus jack from an electronics supply store or via mail order.

My box uses the card that came with the Microsoft Bus mouse. If one bends the metal bracket on the card parallel to each side of the circuit card and cuts the circuit card at the bracket ends, the resulting card will fit into most small electronics project boxes of about 2" x 2" x 3". I took the resulting card to a local Radio Shack and found a box

that would fit for under $3.00.

Place the card into the box and determine where to drill two holes: A big one for the PC Bus mouse to plug into the card, and a smaller one for the mouse cord which will plug into the Atari.

Once the holes are drilled, use an ohmmeter to determine where, on the "chopped" circuit board, the pins of the jack can be accessed. This allows for easier connecting of the Atari mouse cable to the circuit card. Ideally there should be a row of un-used solder pads on the top of the circuit board, near the jack, which can be used for this purpose. Keep good notes and/or label the solder pads so you know which ones lead to which pins on the bus jack. Also keep in mind that the pin numbers on the jack are mirrored left-to-right, as compared to looking at the bus connector on the mouse itself.

Thread the end of the cable which will be leading to the Atari connector through the small hole in the project box so that the plug is outside the box and the leads are accessable within the box. Tie a knot in the cable about three inches from the ends of the leads to prevent the cord from being pulled out from the plug end.

Solder the appropriate wires of the Atari cord to the solder pads on the circuit card which match the proper pins on the Bus connector. Before connecting the box to the Atari for testing, double check all connections my using an ohmmeter, making sure the PC Bus pin-to-Atari pin assignments are correct.

Test the box by plugging the Atari connector into the computer and the Bus mouse into the jack of the circuit card, making sure to test all functions (left/right/up/down cursor; left/right click). If there's a God in Heaven and all is right with the world, everything will function properly. If it doesn't, take a look at TROUBLESHOOTING below.

Once you've verified that all works well, place the ciruit board in the project box so the mouse connector lines up with the hole drilled for it and hot-glue the circuit board in place using plenty of glue along the edges of the metal bracket. Pull the mouse cord to the Atari connector so the knot in the cable is placed against the inside of the project box, making sure the leads to the ciruit board aren't being stressed, and hot glue that in place as well. Before securing the lid to the box, make sure that the PC Bus mouse easily plugs into the connector in the box. Then secure the lid to the box, and you're good to go!

You now have an interface that should let you plug any standard PC Bus mouse, trakball or cheese grater directly to the Atari without any further modification. In other words, you won't have to do this again and won't have the excuse again later, so you might as well sit back and have that beer now.

TROUBLESHOOTING

Those making an interface box will likely experience the most difficulty, as it is easy to lose track of where on the circuit board one can make a good connection with a particular pin on the connector. Being careful and meticulous and using a "paper brain" will help avoid problems later on.

The first thing to do, of course, is to check all connections to make sure the correct pins are connected to each other, and check each connection to make sure it is electrically secure and complete. If this fails, try using some of the tips below, which is basically the same advice in table form: ;)

Symptom	Probable Cause	Solution
Mouse cursor movement reversed (left moves to right, up moves down, etc.)	XA/XB or YA/YB signals reversed for horizontal, YA/YB to signals for vertical problems.	Reverse XA/XB signals
Mouse cursor movement really hosed up (left moves up, up moves right, etc.)	XA/XB and YA/YB signals connected to wrong pins PC Bus/Signal/Atari Mouse table	Ensure XA/XB and YA/YB connected to proper pins as per
Right or Left mouse button does not work. _or_ are reversed. This can be checked by trying each button as if it were the other button.	Signals not connected correctly; Check the signals; Check not reversed.	Check pin-to-pin connections for mouse button signals; Check to ensure Lft Btn and Rt Btn signals are
Any given function does not work.	Signal not properly connected.	Electrically check the connection for that signal; Check pin-to-pin connections.
All else fails.	Did not try, or did not try again.	Did Try; Try again.

Set forth in electronic text for all posterity this 29th day of May, 1994, for the edification of the masses and to while away a few moments that would otherwise have made up a dull day,

Michael Parrott
mparrott@kendaco.telebyte.com

Many thanks to everyone who's ever written anything whatsoever about modifying a bus mouse to work on an Atari computer, whether in textual or graphic format. I've tried not to draw directly from any other source for this file, but have surely been influenced by other information I've found on the subject, so thanks to those folk, whomever they may be,

are definitely in order. So there.

>My gripe is their failure to come to grips. Such a great program ... pity.
I quite a gree, although it has to be said that Compo are ONLY the
distributor and have no part in the development of Protext which is still in
the hands of the original team.

>To repeat, I'm running Protext 6.5 on a TT and also on a Mac
>Powerbook 150 (030/b&w) via MagicMAc where it far outperforms anything
>(and I've tried a few) on the Mac side.
Again, I know what you mean. I completely typeset and printed at 600dpi my
book using Protext. Using any other program would have taken MUCH longer and
have been more hassle. Protext is so intelligent and the print quality using
a HPLJ4 surpassed anything else available.

>That recent non-review of Protext 6.6 in Atari World was a large
>letdown.
Yes, the choice of reviewer was disappointing IMHO.

>Also, what about the journal "Exfile"? I'm a subscriber and you,
>I believe, are a contributor. Another pity to drop it as well.
I can't see EXFILE being continued. I've not heard anything from Mark Tilley
about it recently. It was an excellent little journal and I learnt a
tremendous amount from it.

>Perhaps the sun will come out tomorrow. (Tho' likely not where
>you live ;-))
Not ATM, although we had the best summer perhaps for a hundred years or
more up to last week ;-(

From: bede@newshost.li.net
Message-ID: <42i40h$dvv@linet02.li.net>
Source record: 159588

Mark:
Neil Martin of Cardif managed to ferret out from Compo the actual
existanec of Protext 6.61. Here is what he reports ...

New features for 6.61
colour graphics
compression of print files to speed up graphics printing
images located in any column
$ now means revert to previous style
metric measurements now in mm rather than cm

The new printing features are not supported on all printers.
The new version includes a quick reference sheet.

I suggested it might be a profitable exercise to mail all the
registered users with details of the upgrade as it seems (to me)
worthwhile. He agreed, but wasn't sure where to find the list!!!

Meanwhile I have ordered the upgrade so if you want to hang on a few
days I'll send you more complete details."

Good sleuthing, Neil. Either he or I will report here after the
upgrade is received. Unless Compo is shamed into doing it sooner.

I have the following Atari-related Hardware items for sale:

1 Atari SM124 Monochrome monitor. Good condition.
$30 plus shipping.

1 Atari SF314 External 3.5" DS/DD Floppy Disk Drive, w/power supply.
$20 plus shipping.

1 Epson Action Printer 3250. 24 pin dot matrix. ESC/P2 compatible.
Excellent condition. $75 plus shipping.

1 Beetle Mouse. Hi-resolution, long cable. Red w/Black buttons.
Excellent condition. $10 plus shipping.

1 ICD AdSCSI+ host adapter w/real-time clock. Driver software and
manual included. $50 plus shipping.

1 Toad Computers Shoebox Hard Disk Enclosure w/power supply. Holds two drives.
SCSI In/Out. Front mounted power switch. External SCSI ID selectors.
$50 plus shipping.

Most prices are negotiable. I'd prefer UPS C.O.D. (add $4.95), but can also
work with other other methods.

I am looking to set up a small BBS with the aim of it getting
larger over the next 12 months or so. Basically can anyone
recommend an easy to use, powerful system?

Rod

Well, I've been a sysop of my system and so far I've used three different products...

Triplink (now called Intrepid BBS) - Pretty easy to use, Shareware, a little old-style looking compared to some, but pretty sturdy and not a hog on your system (2megs reccomended).

TLC (no longer developed) I beta tested it, and it was the best <sob>.

Foresight (currently betatesting) - Should be released soon, very modern and "slick" looking, pretty powerful, 1-2meg needed, 4meg if you want to network without any weird problems occuring when you do something silly! hehe.

It should be publicly available soon, and is donationware. Easily on par with Ratsoft IMHO.

...Hope that helps.

There is also Octupus which has a strong following, what does your system 'look' like, ie: MagiC? Geneva? TOS? Meggage?

} Hey, has anybody got any experience or clues for MIDI applications in
} Forth, preferably on an Atari ST? I've just set out to explore...

Thanks so much for the responses I've received (nearly a dozen)!! Over the labor day weekend I "auditioned" a half-dozen Forth's for the Atari ST (wow, that's impressive by itself), and have tenatively settled on Forthmacs as the best for my purposes. I'll look for Formula next. Again, thanks for the help and tips...

We're talking about serial fixes for use with MagiC here, and that's like
talking about a fourth leg for use on a three-legged stool. MagiC does not
need serial fixes, period.

: Has anyone tried this demo yet of Positive image?

: Yawn, why is it so slow! My god, it's like watching paint dry! I hope
: the release version will be a bit faster at screen display than this is!

What hardware are you using ??

Try the options dialogue and ensure that VDI drawing is turned OFF. The program uses direct screen access this way and is MUCH faster. (Assuming you have standard Atari hardware IE No graphics cards).

If you already have Internet connection with your PC, use it, and save the
stuff you get, to MS-DOS disks. Falcon will read them OK.

There are not any easy to run/install WWW-browsers for Falcon, I
use Connect 2.46e terminal software for netsurfing (with UNIX-shell
VT-102 connection).

I suppose you have some hypertext-files (.HYP) and a couple of .IMG pictures
about the modifications. ST-Guide is the hypertext program you need
(there's a version in almost every atari-ftp-site. In PC there are
multi-format picture viewers that can show .IMG-pictures, but you could
also get an Atari-program Gemview (version 3.xx), which is a bit slow,
but it can show 99% of any pictures you care to drag over it.

Try ftp.cnam.fr, src.doc.ic.ac.uk (directory pub/packages/atari/umich)
or some other well-kept ftp-site.

Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other.misc

I'm looking for a Practical Periferals "Monitor Master" or
the equivalent for my old ST. It is of prime importance
to have the RCA-style audio and video out ports.

Someone recently sold one of these in c.s.a.st for $15
which seems like an ok price to me--if you disagree then
offer what you think is appropriate. If you have one of
these gathering dust and are will to part with it, please
drop me a line.

From: hallvart@oslonett.no
Message-ID: <42kjvr$bok@sinsen.oslonett.no>
Source record: 159457

I'm curious about what SLIP/PPP is....

I know that it's some sort of "direct connection" to the net
as opposed to the usual terminal emulation that I am using now
via Connect, but this is just about what I know.

What are the pro/cons compared to a terminal emulation connection,
how do you set it up, what is needed of software/hardware...?
I'm grateful for any information.
Thanks.

Connect, IMO, is the best term. prog. around ATM. You will need to
register, though, as the evaluation copy (have a go!) only gives 30 hours
use.

a> I also was
a> wondering if anyone had the docs for memory upgrades to the 1040 so it
a> can be a 4 meg machine?

I did this job on a STM a few months ago. The EASIEST way is to find a
Marpet Xtra-RAM board and fill it with SIMMs. If you want to do it the hard
way though (as I did for the 1Mb->2Mb step) there are Barry Orlando's
instructions on most BBS. He describes how to doctor chip sockets and fit
them to the existing holes in the PCB. The files are called 520_UPGR and
2MEG_MK1 (either ZIP of LZH). Basically you need to replace each of your 2
banks of 256Kb chips with 1Mb chips - the biggest job is getting the new
address line (A9) to them.

Hi All,
I've got loads of stuff that I've been wanting to get rid of for a while
so if you want anything then give me a mail, anyway let's just get on with it.

All games cost One UK Pound + Appropriate P&P (ie actual cost of postage + jiffy
bag(20p)). All games are original and normally come with manuals. If you wish
to buy more than 2 products then discounts may be made available. If you want to
buy or want more info then mail: paul@pwomar.demon.co.uk. Please not that I can
NOT send parcels out of the UK or accept payments not in UK Pounds.

Games:

Try Ghostlink. a serial cable connection between your ST and PC. You create
drives on your ST that represent drives on your PC. so to copy, just
select those files you want and drag them over. too easy.
support shareware.

I used to run a BBS using Wayne Watson's user-friendly program Transcendence. It's freeware for now until he finishes the new version he's been working on for over a year now. It might be found somewhere on the net, or you can download it direct from his board at (803)879-4186.

Very easy to setup and use. Small or large setups no problem. This is a great program to use if you don't like writing scripts for everything (ala BBS Express... and others.)

Not claiming this to be the best out there (I haven't tried ALL of them!) But Transcendence served my users well (most were suprised to find that an Atari was behind it all! "How'd ya get your Pong machine to do that?")

Good luck!

3494. Best hard drive for Cubase Audio on Falcon?

Right (after reading twice :-).

TOS 2.06 is the TOS version which runs on all kinds of STs (if you have
an STe/MegaSTe or have a ROM card which allows to plug the ROMs into
the $e00000 adress space).

3501. Please help on 1040STf

Newsgroup: comp.sys.atari.st
Date: 1995-09-06 00:00:00 UTC
From: as475@cleveland.Freenet.Edu
Message-ID: <42iom8$ljp@usenet.INS.CWRU.Edu>
Source record: 159530

Thanks for those of you who read this and even more thanks in advance
for those of you who help me in my quest. I have an Atari 1040STf which
I just fired up after being ofline for about 6 months...I am sorting
through damaged disks and lost programs so I would like to know if
anyone out there has any good term program thoughts...I have uniterm
right now but I don't like the fact that it has no redial feature and
lack of menu structure kind-of turns me off. I need something vt100+
and a nice ability to D/L on XYZ. I also was wondering if anyone had
the docs for memory upgrades to the 1040 so it can be a 4 meg machine?
I know that Toad Computers has some nice stuff but I would like to see
what people have out there...If anyonwe has any ST items forsale please
let me know as well...I'm looking for SCSIO HDs and the SCSI card for
the ST. Any hardware that you may not want please email me. I really
do appreciate any replies that help me out!
Thanks!
_Jesse

3503. [Q] What BBS software to use, must work w. CDROM

Newsgroup: comp.sys.atari.st
Date: 1995-09-06 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <42ipb1$i5a@status.gen.nz>
Source record: 159532

Hello,

The Tariland club here is trying to upgrade their BBS.

At present we are using ST Keep, but have found this unsatisfactory. We have installed QBBS (with no key), and it would appear that this is the way to go. However, I believe there is other excellent BBS software, such as Ratsoft ST.

The software would need to:
- work with a CD ROM without need for an external door.
- allow the use of ASCII, ANSI and VT52
- allow user defined menus/scripts so as to completely customise the BBS
- hopefully work correctly under a MultiTOS (i.e. either be GEM based and run in a window, or a "TOS" programme which can then run under Miniwin.
- allow the posting of public/private messages
- allow users to upload and download files to and from the hard drive
- allow groups of users to be created, so that some users can have their access to certain areas restricted
- all the normal functions you would expect of a BBS, basically.

Thanks for any help!

-Mario Becroft (mbecroft@iconz.co.nz)

What you are looking for is a VIDI12ST IMHO.

Works great on my STM and TT and produces really nice grabs. Needs a still video input though. Either a decent freeze frame on the VCR or a static scene through a camcorder.

I don't have one for sale though. In the UK they retail for about 69ukp - though there must be 2nd hand ones around.

:-)

Source record: 159539

Hello,

I have a 520STfm and is currently using the RF out for video.
Since I could find some old PC monitors cheap here, could I use those monitors (CGA and dual display) with the ST? If it is possible, any hints to make/find the necessary adapter? BTW, my ST have 1 bank of RAM sockets not used (the other used 4 4c256 chips). Here, I have some spare 41265 chips, could I use these 41256's to fill up the other bank? Any necessary jumper/connection setting to bring this bank to life? Thanks a million.

Best Regards,

William

From: smoore@chowgar.demon.co.uk
Message-ID: <810396666_OASIS_@chowgar.demon.co.uk>
Source record: 159540

Hello

FOllowing on from my post of a couple of days ago I have now got a lot further into this game. I've got the mace of elements fully charged and killed everything I can find on the first four levels but there are still two doors I can't open.

The first one is one level 3, after I've killed the Golems in the library I went through the door they were guarding into the room that tells you about the mace of elements, then through the next door where there are three scrolls that mention somebody else. There is a blue looking door here that I can't open. I've tried all the keys I've found but no use.

The second door is inside the Ice Elementals area. It's in the middle of the big room just opposite the secret door behind which lies the place where you charge the mace of elements.

I can't find anywhere I haven't been and I think I've done everything I should have done up to know, I got a load of spells, even though I can't cast lightening bolt yet, and looking at the maps that were around a couple of months ago I seem to have been everywhere.

Can anybody help??

p.s. Can the person who e-mailed me about this get back to me as I've lost your address.

Cheers.

Source record: 159543

>You're close, but your history needs a little brushing up on. It was TOS 1.62
>that caused history to be rewritten, not TOS 2.01 and 3.01.
hmm, not my memory of events over the past years at all. In fact I recall
stuff from Pratt et al on this matter that it was TOS 2 and 3 that changed it
as TOS 1.62 was already out by then. I remember because I've always had a
vested interest in this because of PROFILE 2 and it's precursors, ST_TYPE and
ST_DATA. Anyway, it's a minor point of little consequence so I'll agree to
disagree :-)

>What's amazing is Atari claimed, for example, that TOS 1,04 was _always_ 1.04,
>even though their own Rainbow TOS docs repeatedly referred to it as 1.4.
Yes, in fact in most quotes from Atari staff in ForumNet echoes and here and
in the docs I have they seldom used the new number system.

>And who but a moron would make a very minor update to a v1.06 and call it
>v1.62???
Atari?
Quite, see my docs for PROFILE 2 which makes this point.

>This was all done to explain away the way the TOS version is stored and read in
>the ROMs, and it was all brought about when TOS 1.62 came out and started
>confusing programs that read the TOS version the old way.
Yes, in fact many called it 1.98 as they took the minor version number to be
a hex value and converted into decimal.

EH>> shareware text editor), that, I assume, simplify the process even
EH>> further.
>
> Have you got a file name for that "kï¿½rzel" (kuerzel) file?

Hah! That's an easy one. The Kuerzels you're referring to are described as
follows:

-------------[cut here]-------------------------------------

This archive contains a *.KRZ-file to speed up the development of HTML
2.0 documents using the Everest text editor (or an editor that can handle
Everest *.KRZ files).

Full details in DOC file.

----------[back in real time]--------------------------------

This package is included in Everest 3.5S, and the author is the same guy who
translated the program into Swedish: Nils Ekholm.

If all else fail, it's available where supported shareware is usually found -
at Dada & Surrealismus BBS, tel+46-40 30 29 93 in Malmo, Sweden.

Hi Steve,

>> Can anyone tell me if Ian Scott is still taking regerstrations for
>> Grandad 1 & 2

Last time I communicated with Ian, in May last year, he'd moved over to some stupid, well known platform, and said he wasn't supporting the Atari line any more. As a matter of fact, he was considering porting Grandad to the PC...

He probably still supplies registered versions/keys though.

I also asked him if there was any chance I could continue playing Grandad II on my (then) newly bought Falcon, but he had no idea how that could be achieved.

Towns' Little Guide to TOS Revisions, version 1.0, March 1991.
---------------------------------------------------------------
Written by John Townsend, Atari Corporation

This is a small document that explains in very terse terms the
differences between the TOS revisions available for ST/MEGA/STE/
Mega STE/TT machines, what patches are needed for what revisions, the
formats they are available in, and any notes I can think of.

I hope this will clear up some of the confusion with the different
TOS versions. If you have any questions on this document, please
let me know here on GEnie. My GEnie Address is: TOWNS.

Special thanks to Leonard Tramiel, Allan Pratt, and Doug Wheeler
for their involement with this little Document. Thanks again!

Comments are welcome..

-- John Townsend
Atari Corp.

================================================================================

ROM TOS (TOS 1.0)
-------

The original ROM TOS, this version shipped in 520ST and 1040ST
machines. It is no longer shipping in any machines.

Formats: 2 chip ROMs, 6 chip ROMs

Machines: 520ST, 1040ST

Utilities: FOLDRXXX.PRG

FOLDRXXX.PRG will add more entries into your OS Pool.
In TOS 1.0 and TOS 1.02, the limit for the number of
directories that you can enter is around 40. With this
program you can extend that limit much higher. If you
are using a hard drive, this program is recommended
highly. It will work with all TOS versions and will
improve the performance of your system.

Notes: GET TOS 1.04 TODAY! TOS 1.04 is the latest version of TOS
for 520/1040/MEGA owners. It is MUCH faster, has faster,
better disk I/O, many other improvements.

MEGA TOS (TOS 1.02)
--------
```

This is commonly referred to as MEGA TOS. This version of TOS fixes some minor problems in TOS 1.0 and has support for the BLiTTER chip and Real-Time Clock chip.

Formats: 2 chip ROMs, 6 chip ROMs

Machines: 520ST, 1040ST, Mega 2, Mega 4

Utilities: FOLDRXXX.PRG

FOLDRXXX.PRG is explained above.

Notes: See notes for TOS 1.0.. GET TOS 1.04 TODAY!

Rainbow TOS (TOS 1.04)

TOS 1.04 or Rainbow TOS, as it is commonly known is the latest version of TOS available for 520/1040/MEGA owners. It has been available as a dealer upgrade for awhile now. It has much more robust Disk I/O, Autorunning of GEM programs at boot up, a fix for the 40 folder limit, and much more. Most of all is it much faster than previous versions of the Operating System.

Formats: 2 chip ROMs, 6 chip ROMs (available as Upgrade!)

Machines: Stacy

Utilities: TOS14FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG

TOS14FIX.PRG solves some small problems in the AES (for additional information, please see the documentation that accompanies the TOS14FIX.PRG program).

POOLFIX3.PRG fixes a bug in GEMDOS. Documentation that accompanies the POOLFIX3.PRG program explains (in detail) the problem that it fixes.

CACHEXXX.PRG is a new program that adds GEMDOS buffers to your system. The caching of data and disk directories by GEMDOS (when this program is used) will result in your system running much faster! This program is highly recommended and requires TOS 1.04 or higher for full benefits!

FOLDRXXX.PRG is explained above.

Notes: Please use the utilities available and if you haven't upgraded to this version of TOS yet.. please consider doing so. It's a very worthwhile upgrade.

There are some disk-based versions of _early_ developer only releases of TOS 1.04 floating around on BBS systems here in the United States and abroad. Please don't use them! They are bad news! They have some very nasty bugs and have been known to corrupt data!

STE TOS, Rev 1 (TOS 1.06)

TOS 1.06 is the TOS version that is shipped with the 1040STE and
520STE machines. It is essentially TOS 1.04 with support for the new
hardware that the STE has.

Formats: 2 chip ROMs

Machines: 520STE, 1040STE

Utilities: STE_FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG

STE_FIX fixes the infamous Desktop Medium/Low resolution
bug. The problem is that there is a bug in the desktop
code in this version of TOS that prevents the user from
booting into Medium Resolution. The patch program STE_FIX
will solve the problem. Once it is executed in the AUTO
folder, the problem no longer exists.

FOLDRXXX.PRG, CACHEXXX.PRG, and POOLFIX3.PRG are
explained above.

Notes: This version is only available in 1040STE and 520STE
machines. It isn't available for upgrading. It won't
work in older machines.

STE TOS, Rev 2 (TOS 1.62)

This is a slightly revised revision of TOS 1.6. It fixes the POOLFIX
problem in GEMDOS and the problem in the Desktop that was present in
TOS 1.06.

Formats: 2 chip ROMs

Machines: 520STE, 1040STE

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only available in 1040ST and 520STE
machines. It isn't available for upgrading.

Mega STE TOS (TOS 2.05)

TOS 2.05 is the version of TOS currently shipping in the Mega STE.

Formats: 2 chip ROMs

Machines: Mega STE

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only available in the Mega STE. It isn't
available for upgrading.

TT TOS (TOS 3.01)

TOS 3.01 is the version of TOS that originally shipped in the TT030.

Formats: 4 chip ROMs

Machines: TT030

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only avaible in the TT030. It isn't
available for upgrading.

TT TOS (TOS 3.05)

TOS 3.05 is the latest version of TOS currently shipping in the
TT030.

Formats: 4 chip ROMs

Machines: TT030

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG, SERPTCH1.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only avaible in the TT030. It isn't
available for upgrading.

==========

Pretty close to definitive, eh? Still doesn't really answer the
question "What problem on bootup with TOS 1.6? If that's all I've
used, how can I know the difference?

: I myself use Feeze Dried Terminal Version 2.2, it has a lot of functions in
: it and works very nice. I know that the product is no t suported anymore
: but it seems to not realy need very much more then what it already has.
: I am very happy with it and would recommend it to any one using a standard
: 1040STf.

I agree, I also used Freeze Dried Terminal before I bought my Falcon030,
now I am using Connect, but according to me Connect is way too slow on a
standard ST. Go for FZDT, is a great piece of software!

: Just my thoughts, I am sure others will argue this but that is for the same
: reason why a lot of people seem to like STalker, I myself tried it and
: could do without, all a matter of preference !!

Right! 8-)

3519. Combiner for cartridge port

Newsgroup: comp.sys.atari.st
Date: 1995-09-06 00:00:00 UTC
From: martinna@cf.ac.uk
Message-ID: <DEHzq8.BHr@cf.ac.uk>
Source record: 159548

Does anyone know where I can find a combiner for an stfm cartridge port
so that I do not have to keep swopping dongles?

All help appreciated.

Neil

I would recommend Octopus BBS.

It does all this and more....

CD ROM no problem

The BBS it 95ontrolled by a script file only a very few set areas.

Gem Based Yep , I run it here as a GTP.

Upload/Download Of course

Access Level and User Keys , restrictions to message areas / file areas
and evan menu functions depenatnt on the lele or/and key if you want to.

I have the following items of orginal ATARI games software for sale ,

All are in their original boxes and also with all the accompanying bumf that
came with the items at the time of sale.

3 quid each plus p+p.

Atari Family Curriculum Pack (postage only)
Backlash
Bubble Dizzy
Blood Money
Captive
Crazy Cars II
Cool World
Chuck Yeagers Advanced flight trainer 2.0
Carrier Command
Castle Master
E-Motion
European Space Simulator
Fighter Bomber
Gravity
Gauntlet II
Hunter
Hard Drivin
Hard Drivin II
Hawaiian Odyssey scenery Disk for Flight Sim II
Interphase
James Pond II (robocod)
Knights of the Sky
Leisure Suit Larry goes Looking for love (in all the wrong places)
Leisure Suit Larry in Passionate Patti in pursiut of the Pulsating Pectorals
Legend Of Djel
Mr Heli
Millenuium 2.2
Midwinter
M1 Tank Platoon
Magic Fly
Night Shift
No Second prize
Nevermind
Orbiter Space Shuttle Simulator
Pacland
Pacmania (3d pacman)
Populous expansion ~ The Promised Lands
Powermonger

Power Drift
Populous
Puffy's Saga
Personal Nightmare
R-Type
Rainbow Islands
Robocop 3
Stunt Car Racer
Starglider
Star Wars
Silkworm
Sleeping gods lie
Treasure Island Dizzy
Trivial Pursuit (a new beginning)
The Chaos Engine
The Newzealand Story
Virus (game) & virus killer (not a game) (count as one)
Voyager
WizKid
Whirligig
Warhead
Western European scenery Disk for Flight Sim II
Weird Dreams
XYBOTS

Software NOT games

3D contstruction Kit
Adavanced OCP art studio
Tempus 2 editor from hisoft
STOS & STOS Compiler (count as one)

> chips, could I use these 41256's to fill up the other bank? Any necessary
> jumper/connection setting to bring this bank to life? Thanks a million.

1) I have succesfully hooked a CGA monitor to an ST with nothing but a propper cable. But due to incompatability between the TTL signal used by CGA, and Analog used by the ST, instead of getting the full 512 color spectrum, you only

get eight. This is fine for comms, word proccesing and the like. But games look

auful! You also don't get audio. (The monitor I used also included Composite and Audio. I lucked out.)
2) Dunno what you mean by "Dual display"
3) I did this type of RAM upgrade on the machine I'm using right now. Just sodder the chips in the empty bank. And sodder a .1uF capacitor next to each chip. That was the hard part. To get this extra RAM to register, look for a row

of resistors, they will be located near the MMU. (one of the big square chips) There will be three unfilled spaces on the end, fill these in with the same type of resistors as the rest of the row. Make sure to get quarter or sixth watt resistors.

>How is the Atari ST doing? IS Atari still making them?

Hi,

1. No, they gave up a while back. 2.Great, the games scene is alive and kicking on the STE (STFM's are seemingly being phased out of the games scene). 3. New C-Lab falcons are available and are becoming world beaters in the music and graphics side (APEX and Expose)

Hope this helps with your query.

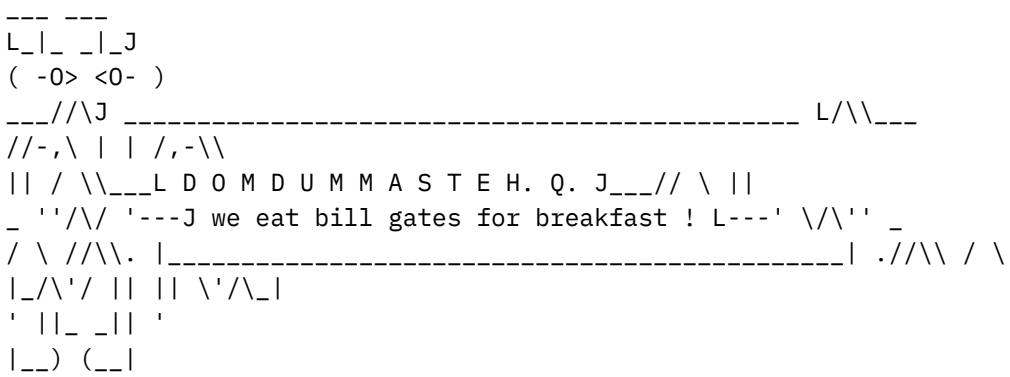
Has anyone in here got a ZIP drive yet and could speedtest it ?
I want to know the ordinary stuff and preferably on both 25 and 100
Mb disks. I'm *not* interested in what the company who made it says
but what *you* measure it to with HUSHI or some other known tool.

Cheers,
Martin R.



3534. Falcon NVRAM problem solved

Newsgroup: comp.sys.atari.st
Date: 1995-09-07 00:00:00 UTC
From: nuuja@cc.Helsinki.FI
Message-ID: <42lli9$hbp@oravannahka.Helsinki.FI>
Source record: 159470

Thanks to Eddy Morfan's brilliant idea, my Falcon is up and running
again!

The Story:

I messed up with the NVRAM and "killed" my bird. No picture on screen,
keyboard not working, external data storage devices inoperative. And the
particular clock/NVRAM chip version in Falcon (at least in mine) cannot not be
reset externally. So there seems to be no other choice but to replace the
whole chip...

Then suddenly Eddy Morfan comes up with this great idea. The machine has to
be "booted" from a cartridge. I start looking for a suitable cart base.
Thanks to Pauli Leppala, I get one. Then I write a simple program to be
put on the cart. After buying two eprom chips, I begin to look for a
prommer service. Finding one turns out to be very difficult. After 12
hours of continuous search and visiting numerous companies I finally
find a computer repairs company that agrees to burn the program on the
chips. They don't even ask for any charge for doing it! Too bad I can't
recall the name of the company...

When I get home I put the chips on the cart on insert it in the cart
port. Then I turn the machine on. Nothing seems to happen. I switch the
chips other way round. Nothing happens. I start to get desperate. After
closely examining the cartridge I begin to understand that it has to be
inserted "upside down". I switch the chips other way round again and
insert the cartridge. Then I turn the machine on and... nothing still
happens. I decide to switch the chips other way around again (although
it doesn't seem like a very logical thing to do). Wondering if I've
already caused a short circuit, I insert the cart for the fourth time
and turn the computer on. For some unknown reason the cartridge finally
does what it was built for. The Falcon is alive again!

Technical details:

After doing some more research on the NVRAM I found out that the cause
of the problems is a single NVRAM video register. Writing an
inappropriate value in this register not only causes video problems but
a total hardware deadlock, too! The cause of this problem is a software
bug in the TOS code. I do not know if similar situation is possible on
a more up to date Falcon TOS. My TOS version is something about 4.01.
I'd be happy to replace my TOS chip with a new one if someone wants to
sell me one.

: > one of those damn grey things.

: Hello Simon,

: I can't help you because I'm stuck at the same spot I believe.

: There are three connecting rooms here, right? Teleporters are in the center
: room, and the room with with smaller antechamber.

: I've not found the drop through door. Where the heck is that? I've not been
: able to kill one of those little whorlwinds either. I'm thiking of
: walling them in.

: How did you get the teleport spell? I don't have it. I've got
: "heal" 'hammer' 'Wall of fire' 'food' 'Make wall'.

: I'm still working on it, so let's keep in touch and try to work through
: this game if you don't mind?

Ok, this should help you two out...
In the earth area, behind one of the doors. There is a chain, bag of
holding, a pit, and an earth elemental.
You need to fall in the pit. In there, is a theif and you need to give
him an item.

Well if you already have NVDI - then the blitter is a bit of a waste of time IMHO. NVDI is more efficient than the blitter in many respects - and often (if not always) turns the blitter off.

Try doing some tests without NVDI loaded. The speed differences are noticable then.

:-)

Roland.

It seems to me like you don't have an 1.44 hd drive in your
ST. Anyway, do like this:

1. Format some 720 kb diskettes on the PC.
2. Copy the 1.44 mb disks to the 720 kb disks.
3. Use the 720 kb disks in your ST.

Mikael Hillborg (msumik@eua.ericsson.se) wrote:

: (Where) can I get Csound for my Falcon ?

The Composers Desktop Project (A collection of sound synthesis and processing tools for Atari ST/TT/Falcon, PC and SGI) have done a port of Csound for the Falcon. The problem is that last time I heard, this package was very very expensive - I have used the ST and PC tools, and although they can produce excellent results, they are also difficult to use and have a number of anomalies in the way they operate.

To get more details, try emailing Tom Endrich tendrich@cix.compulink.co.uk or Richard Dobson masrwd@bath.ac.uk (snail: 3 Farrant Road, Frome, Somerset, UK, BA11 3EP).

Cheers,

Richard.

>Cubase problems below.

A/V means generally a drive that has sustained data rate, and does NOT
do thermal calibration. And that's just what CAF needs.

It doesn't matter how fast your drive is - if it calibrates it will
destroy your work under heavy and continuous work. Try to use a calibrating
drive with 8 tracks of continuous audio (different recordings in each track,
more than 10 minutes long), and it's a mess.
Also, cycling Midi & audio is a good HD-test, it the drive calibrates and is
thus too slow, they drift slowly out of sync.

>don't think that the FDI gets too hot by standing over the drive -in fact, it
>was meant to be put there...

I have all the fixes done. I did over 100 offline tests when finding out
the reason for that problem. The reason _was_ FDI's placement. It could be
that Wings-card and other circumstances are different to your machine's
specs, but nevertheless the reason for the clicks was FDI's placement,
and they disappeared after the FDI was placed on the desk and things cooled

down.

All other audio functions, playing/recording and manipulating/sync works
fine, it affected only those two functions.

>impossible to record on the drive. I can also tell you that with a Conner 1 GB,

>For some strange reason, Atari have limited the SCSI-II port to 2 MB/s, but
>it's enough to be able to make audio recordings, so don't worry.

A good test if the drive is good for audio is to put HOW_FAST.PRG to make
500 read/writes of some equal amount of bytes (eg. 30Kb). In the resulting
graph you'll see how it can do continuous read/writes, and the effect of
calibration. In my IBM DPES-31080 the graph is almost straight line from to
the end, and even it's relatively slow (1.4 Mb/s) in tests, it performs
flawlessly with CAF in full load.

>In most cases it's best to disable all software hard disk caches, since
>Cubase handles the reading/writing in it's own way and extra caches may
>interfere with the main program.

But CAF bypasses the hard disk driver when playing/recording audio. It uses
the driver for Offline only (info from Charlie Steinberg).

All those games are superb. DM is slow when compared to
Captive/Knightmare. But it has better feeling, and clear
graphics.
I bought DMII to my brothers (PC). It is not as good
as I hoped it to be. They have change the spelling
and fighting system to wrong direction.
I wrote to Interplay/FTL asking are they gonna convert DMII
to Ataris (Falcon).
Maybe they don't but there is allways Ishar series for
Atari, and especially for Falcon owners it's recommended
(2 or 3) if You like RPG:s. And for Falcon there is
Towers II too and Substation.
And other shareware for Falcon is Lasers et hommes II.
I'm waiting for next Towers game, if they improve it as much
as they did from Towers I, it will be a killergame.
Now I continue playin TowersII, where I'm stucked in 12th
floor.

I'm in level 12 on Towers II. I'm not sure where You are, but
those snakes (that I couldn't kill either) are only on level 3,
I used this method to snakes; if there is doors in those three
teleport rooms, after I find the door I opened it, if there was
snake in room, I run and Snake came after me. Then I go through
the door that I was opened earlier, and stand up and wait for snake.
If you are close enough door, and closed it, snake get jammed
to it. If you are too close, you get jammed (and snake doesn't) !

I'll tell more after I play it again and find the place You are
really talkin about.

There are basically 2 WAV-Formats that are not yet supported by our
525. It's 4 bit (hm, all I say is PC!) and ADPCM, which is a kind
of packed format. We are working on both at the moment.

If someone wants us to include new or extended formats, there are 2 things
he should do:

1. Send me the file that does not work or is not supported
2. Send us the registration fee ;-)))

We are also looking to find someone who could tell us the
structure of the header of .sd sounddesigner files. Any idea?

Can I put a 1.44MB floppy drive in my 520STfm (Rainbow TOS)?
If so, can I also put a 1.44 in my SF354 case (replace the SS)?

Thanks
Larry

3548. Re: Positive image demo, latest news!

Newsgroup: comp.sys.atari.st
Date: 1995-09-07 00:00:00 UTC
From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DEJ9Iq.HxH@cf.ac.uk>
Source record: 159484

Further to my post on how slow I felt the demo of positive image was, especially with VDI plotting on my Matrix card, steve delaney from Floppyshop and Atari World kindly posted me this reply.

Simon

Steve wrote ;
I saw your posting on Usenet re the Positive Image demo. On a standard
Atari setup, screen redraws are much slower in the demo due to the fact that the
current version contains a lot of debugging code which slows everything down.
This will obviously not be the case with the final release version. Also, please
check the Options menu to ensure that VDI Plotting is switched off, otherwise
redraws will be even slower.

If you have a graphics card, VDI Plotting is currently your only choice in the
demo version. However, the full version now supports the Cyrel Sunrise C16,
Coco, Matrix and ET4000 cards directly thus, improving screen redraws on these
setups dramatically. This was added after the current demo version was compiled.

Positive Image is still a few weeks away from final release and the demo is only
designed as a sneak preview of the package. An up to date demo will be posted to
Hensa nearer to the completion date. My software is not currently allowing me to
post to the newsgroups. Please feel free to post this reply on my behalf.

Regards
Steve Delaney
sdelaney@steil.wintermute.co.uk

Well this is encouraging news! I hope steve can post an updated demo version of the software soon, I'll report on its performance with the Matrix Card (TC1208), TT and MagiC.

Simon.

Message-ID: <jerbil-0709950902060001@ppp-nyc-2-46.ios.com>
Source record: 159490

I am selling my Atari SLM804 Laser printer with a fairly new laser installed in it. I am including an additional toner cartridge, a DMA switch (so the LAser printer need not be turned on while running the system), and the Pagestream Publishing Program (v 1.8) with manual. All original docs, controller, and cables are included. It is in mint condition working fine but will need a new drum soon. Drums are available from TOAD ATARI PRODUCTS on their owninternet WWW homepage.

This all cost me around $1900 originally. I am asking $400 or best offer. Buyer pays and selects method of shipping. (FYI: It's rather large and heavy.)

It's a great machine and creates wonderful 300x300dpi "crisp edge" copy.

Please contact: Jeff.

3556. Give your IBM the Look and Feel of an Atari ST - $45

Newsgroup: comp.sys.atari.st
Date: 1995-09-07 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DEJIp4.MFF@freenet.carleton.ca>
Source record: 159492

In reply to my previous post of this same title, Steve Hollman has written>

Quote:

Keith N. Murchison (cb092@FreeNet.Carleton.CA) wrote:

: I have several complete copies of GEM version 3 (the last release
: for IBM)

: With GEM installed, you IBM suddenly takes-on the personality
: of an Atari ST, but runs all of your favorite DOS programs from
: a hassle-free desktop environment (one familiar to any ST Atari
: user).

And if you are fortunate enough to aquire a copy of GEM 1.x, you will find that the desktop.app from the old pre-apple-lawsuit version of GEM will replace the desktop.app from GEM 3 and run quite happily over the newer OS giving you compatibility with newer GEM software and a desktop with _exactly_ the "look and feel" of your ST.

And this really does make an excellent substitute for (cough) File Finder.

Unquote:

Steve has his facts right, version 1.x is even truer to the ST model, in that it features the Trash can, and moveable, scaleable windows, while Version 3's desktop features to fixed ST type Windows (with ST type ICONs, Common menus, common drag and drop features, etc.). Unfortunately, versions 1.X don't run at quite as high a screen resolution when run on a VGA or SVGA monitor. Spefically You get 640X350x16. This difference doesn't effect any DOS applications you launch form the desktop.

I also have two copies of GEM 1.X for sale at the same price ($45). These packages also include GEM draw for IBM and several IBM GEM desk accessories.

Whether you pick GEM 3.0 or 1.2 you are way ahead relative to other user interfaces available for your PC (including the DOS prompt, WINDOZE and DOSSHELL - cough)

: could lie there. Most interfaces can't handle hard disks if the parity check is
: switched on. Link II doesn't care so any hard disks should work with it. Make
: sure that the devices come in order - if the unit numbers aren't in order
: 0-1-2-3..., AHDI doesn't search for them.

Well, I have a MegaSTE myself and the interface built in can not handle
parity, nor two drives. But it's possible to modify the interface, a
friend of mine modified it so now I can run two drives and it doesn't
matter if parity is on or not.

As far I know there is also a replacement available for the internal
interface that can handle up to eight SCSI units and parity

3560. PC - ST compatible diskette formats

Newsgroup: comp.sys.atari.st
Date: 1995-09-07 00:00:00 UTC
From: emel <mellene@innet.be>
Message-ID: <42m9i3$cdl@news.INbe.net>
Source record: 159496

I need to convert some files from the atari st to a pc system.

I have received the shareware PCtrans for the pc and STtrans for the ST

These programs are on a 1.44 hd ms-dos diskette.

The atari refuses to recognize this diskette.

How do i get the atari software loaded on the st ???

Suggestions are welcom as answer or email to mellene@innet.be

Thanks & greatings from Belgium

3561. New Atari Clone by GodFather Computer!

Come visit our web site at:

http://www.netrep.com/home/GODFATHER

We offer a PENTIUM based and 486/DX4-100 based system pre-configured with the new and awesome GEMulator 4 Atari Emulator. The system are super fast, great cases, and offer the best upgrade path for Atari users needing someting more from a PC. If you need to upgrade, come by our home page and check out the GEMbino series of Atari clones that we manufacture at GodFather Computer, inc.

Or call 510/417-6809 for more information.

Thomas Ferreira
GodFather Computer, Inc.
"Knocking Off The Competition"

** We also sell our awesome shirt with the GodFather Computer, Inc. logo on front and our motto "Knocking Off The Competition" on back. Be the first on your block to wear this awesome shirt. "We sure do get a lot of lookers at our shirts when we walk down the street or attend a computer show."

A giant chicken in the guise of Daniel Hedberg clucked:

> Is there anyone who can tell when MagiC Falcon will show up?

Only God knows... (and maybe not even him...) :) hehe...

> I want it badly and I have heard that it's ready but there is some kind
> of problem with the distribution? Also, how much will it costs? I have
> no idea, I don't even know how much you have to give for MagiC 3.

I think they almost released it, but at the last minute caught some serious
bugs and ended up haveing to rework a large part of the code...

> and they've stopped using it (Atari machines have never had any use of the
> parity check - they've worked for years without it and finally, PC's have
> started to get a little closer to the truth).

I heard this quite a while back, but I doubt its changed: The US Govenment
requires parity on all the 'puters it buys, due to paranoia about solar rays
flipping bits. IBM's have used parity since the original PC due to this. There
is a lot* of money to be made off the government ya know... ;)

A little trivia: Apple tried selling Mac's to the government, but they said
"Sorry, it ain't got parity". So Apple made parity memory an option on certain
Mac II models, just so they could make money off the government... (I think the

IIfx had this, dunno what others did...)

Well, I figured out what I was doing wrong. I had used the environment variable RESOLV_CONF_FILE (I believe that's the name, I'm not at my computer at this time so I cannot look it up) to relocate the resolver config. file from u:/etc/resolv.conf to c:/mintnet/resolv.cnf. Unfortunately, either the resolver wasn't paying attention to the variable or the variable was being set after the drivers were loaded by MiNT. Result: No config. file (as far as the resolver was concerned) and therefor no nameserver.
I put the file in /etc/resolv.conf and all was well.

Thanks for everybodies help.

s> thanks

Well 2Mb total is one of those funny numbers which is difficult to get on an Atari. There are 2 memory banks which may each contain 512Kb OR 2Mb. On your machine each is occupied by 512Kb. The next step is to replace oneof these banks with 2Mb. which will give you 2.5Mb total.

This is easily done by using an internal expansion board which will take 2x1Mb SIMMs. I have the Marpet Xtra-RAM but there are others. Just confirm before you buy that it will fit an STF.

There IS a cheaper way but it involves unsoldering one of the internal RAM banks and replacing with doctored chip sockets, 1Mbit RAMs and a number of off-board wires. This is described by Barry Orlando in a text which you will find on a lot of BBSs. I guess you will not want to do this though!

RW> but it will only read and write double density, not 1.44 M (HD).

Uh, not quite. Witness the following announcement:

Computer Direct is pleased to announce the availability of a new
High Density Floppy Drive Kit. It doesn't require TOS 2.06, it
doesn't require the AJAX chip and it doesn't require a lot of money!

This kit comes complete with installation instructions and a high
quality TEAC drive. It is simpler than ever to use 1.44 MB floppies
with your Atari!

Available now from Computer Direct for 149.99 CDN including drive!

All the best,

Chris @ Computer Direct

Source record: 159377

Help needed...I have brought SPectreGCR from an ad, but the GCR unit is broke (well- dented, but I assume broke cos it don't work).

I am told the software will still run but I can't get it to load from the system disk. It prompts to insert system disk, but when I hit return it just freezes up.

It's probably something I am doing wrong (or not doing at all), but I am getting frustrated.

Can anyone help? I use a TT with graphics card (matrix coco) and Magic.

Thanks in advance for any help I can get with this.

>
>
>
>>>>
It can be done and it does work BUT, If your STfm doesn't
have the Western Digital WD1772-02-02, you will need to replace it with
the Atari AJAX controler. The -02-02 is important. As for Formating at
1.44, this will require a special formatting utilitly if you do not have
TOS 2.06. Daimond Back 3 comes with one but it is not PD. There
are some out there but I don't know where.
I just updated my STe to a 1.44 Floppy (already had TOS 2.06)
and it is working GREAT. I've sent the 'How To Do' to "ST Informer" a
couple of days ago along with drawings and pictures. The same logic
can be used on a STf or STfm if you can find the points I used on the
Mother boards but I fear you might have to change the WD1772. The
AJAX controler chips are available from BEST Electronics, $40 each he
quoted me.

I am on a quest to help a poor soul who still runs his 520ST with TOS on disk. I'm sorry, let me rephrase that, used to before the disk was erased. Where can one find/buy another copy so that I and he can live in peace.

Oh yes, I am also looking for mail order places that still sell the old paddles (the breakout version not the driver controller). I know there must be still tons of these still in box.

DUET is supposed to allow networking through the LAN ports, but I
have heard rumors that it only works on the TT.

3585. DirecTT030

Larry,
The way I view it personally is that the DirecTT would be a much more powerful machine. As far as computing muscle this machine would probably be the way to go. However, the Falcon clone would sport better graphics and sound (incdredible sound). Also, DSP apps like Apex Media are impressive from what I've heard.
If you are a game player I might consider a Falcon for the Falcon-only games (Ishar series, Towers II, Robinson's Requim, Bombsquad, some others). Also, because the Falcon has the Blitter it would, I believe be compatible with more STE games than the TT. I am unaware of the compatibility of ST games with the TT, though. They might be more compatible than with the Falcon (someone help me?).
Hope this helps. I, personally, like my Falcon because I am a games player although I think a 48Mhz TT would be a very impressive system.

Alfred,
If you dare you can venture into comp.sys.atari.advocacy where
Rod MacDonald of ST Informer posted some info about the DirecTT030.
From what I know the DirecTT030 is a TT030 clone from a company in
Canada that is in a tower casing and runs at 48Mhz (probably the
Cattamaran upgrade?). The price I heard was a little over $1,000.
I believe the e-mail address of the company was in Rod's post.
Sounds like a fairly good deal.

> foolish enough to buy it.

This is a little unfair - I have a late beta of AES4.1 (ie. not the buggy TOS4.92 beta) and it is very reliable. It's no speed demon, but is a lot faster & stabler than AES4.0 (the one that they released as MultiTOS). I think it does have prospects, although a MiNT aware version of Geneva would most likely be an even better bet. The underlying technology is better than that underlying Windows95, more like NT in terms of what is possible.

Of course, providing virtual memory would be a quantum leap - I hope that they would condsider doing this......

Craig.

You want to contact Wizztronics. They make a single unit that allows up
to 4 (I think) cartridges to be plugged in simultaneously and you can
switch between them. Costs $150 I think.
Or contact TOAD COMPUTERS to see if they carry it. 410-544-6943

Best of luck.

The easiest is to order the Toadswitch from Toad computers. Recently set one up
for a friend and works great. If you want to build your own it is somewhat of a
hassle as the switch must enable the mono select and route the mono signal to
red, green and blue to get a white screen in hi rez.

Try using Zmodem. You're never going to get 1600+ cps without it. I use
the serial fix by Medical Designs...it does the job...

To my knowledge, it was called Rainbow Tos simply because the info box
that showed the Digital Research copyright on GEM/TOS had the Atari
symbol in Rainbow colors.

I use Turbo ST v2.2.0 which is quite powerful. But you might be happier
with Ratsoft, which had the advantage of actually being supported. Plus
is had a few more graphical bells and whistles than Turbo does...

|> > then that would have excluded my WORM drive ! ;-))))

Hi,

I have a 520STfm, 4mb ST-Ram with PAK3 (68030+68882+TOS 3.06 (running at 50Mhz) and FRAK (FastRamCard for the PAK, 16mb of TT-compatible RAM).
I also use a Imagine Mega 256 Graphics-Card (with et4000-Chip, its a bit slow...) it is connected with a 14"-Monitor (it will soon be replaced by a 17"-Monitor).
At the ACSI-Port I use a GE-Soft MegaDrive V Hostadapter with the following devices: ID0: Quantum LPS 105S (105MB)
ID1: Quantum Trailblazer 850S (850MB)
ID2: Quantum LPS 120S (120MB)
ID4: Toshiba XM4101TA CD-Rom-Drive
I have a modem with 14400baud and as printer I use a Deskjet 550C.
The whole Machine has ca 200% of TT-Performance, and I'm planning to raise the speed of the mainboard (the 520ST-Board) to 12-16Mhz. (Because access to the ST-RAM and access to the Harddisks will be quite faster then).
Also I'm planning to raise the speed of the serial port to 56700baud and perhabs I'll add a second RS-232-Port.

That's all,

Bernd

Doesn't the ST use MS-DOS as the disk format? If so, you can read stuff with
CrossDOS (builtin on OS 2/3)

Nope. This is not quite true. If a disk is formatted on a an ST, it
cannot be read by a PC, though the reverse does work (the ST has a
more clever floppy controller than a PC). I've heard that the
commercial version of Cross Dos does allow reading ST disks, but I
haven't heard if this applies to 82 track disks, or 10 sector twister
format (skewed sectors for faster reading).

The version of CrossDos I've got on my A-4000/040 doesn't read my
Atari disks (waitaminit... let me make certain, here) Hmm!! WEll,
that one did (double-sided 720K), though the volume label was goobered
(no great loss), but I can't be certain I didn't format that one in
the PC. (occupational hazard of having all these computers sitting
around!)

I'll have to give it a try with some Twister disks, but I suspect it
won't work, since those weren't even all that standard in the ST
(though the BIOS had no trouble with them). This'll be handy if it
DOES work, since my ST is 700 miles from here.

: Yes.

Let me add:
I have just seen it working on the brand-new PCI-PowerMac 9500/120.
Works very fine; speed (runs in 68K emulation mode) is about that
of a 33MHz 68040.

The soft is purchased by Application Systems Heidelberg (ASH).

Hope this helps...

As far as I know, the only Quantum Empire disk that works with the Falcon is
the half gig. The others are SCSI-III disks and not quite compatible with
SCSI-II according to Atari.
Get a Conner CFP2105S or CFP2107S instead - they work very good with Cubase
Audio. I use a 2105 in my studio.

>Who knows how I can conetct my Atari Mega ST computer and standard
>VGA pc monitor?

If it had been a MSTe, you'd just plug in a graphics card in the VME bus. I don't know how the MST is in expandability like that, but I think Computer Insel still sells VGA cards for all STs. Anyone got addresses please post?
If you don't mind monochrome, however, you could do what I did while I had my new VGA monitor and waitied for the graphics card: Get yourself a multiple line cable, a 13 pin round DIN male connector and a VGA socket (female). Connect the monochrome out on the ST side to R, G and B on the VGA side, put all grounds to ground and put the monochrome detect on the ST side to +5 V, then, of course, horizontal sync to horizontal sync and vertical to vertical. Voila. You can use a VGA montior as a monochrome monitor.
You can't do color resolutions unless you have a multisync monitor SLOW enough to take PAL or NTSC signals. The typical horizontal sync in PAL and NTSC are 10 and 15 kHz (if I'm not too wrong), while the typical VGA monitor, even multisync ones, will demand at least a 30 kHz sync - as far as I can recall.

System Solutions supplied these in the UK with (some sort of) permission
from Atari UK - they're just patched versions of 1.4. Gemulator does not
work with them. Don't know if the 1.41 version number - or any other
non-Atari version number - has ever been used outside the UK.

: The consensus seems to be that TOS 2.06 or more is required to
: format, read, or write 1.44 Meg disks. With some reworking, a
: modern drive mech can be installed into your STfm or the SF354,
: but it will only read and write double density, not 1.44 M (HD).

That's wrong! As far as I know, the only 1.44MB features in 2.06 is that
the step rate is changed to be able to use HD drives/disks as well as
a high density format option on the desktop.

You can use older TOS versions (as far as I know) with HD disk drives/disks-
what is needed is a small circuit that can change between 16/8MHz
(16 for HD and 8 for DD). This frequency is fed into the WD1772
disk controller chip. As for the step rate you can use a small AUTO
program for that, there are several different programs like that around.

The drive has to be able to send out a logic signal which differentiates
between HD and DD, so it can ask the circuit to send 16 or 8 MHz into
the 1772 chip. The density signal should come out of pin 2 of the disk
drives connector, but tehre are probably other ways around this with some
hardware "hacking".
Hope this helps.

: DUET is supposed to allow networking through the LAN ports, but I
: have heard rumors that it only works on the TT.

I've downloaded Duet, and indeed, the docs say that it doesn't work on a Falcon, altho there is a driver for the Falcon LAN port! I sent mail to the author, asking if he still supports Duet, but haven't received an answer yet.

But, there is also ST Informer (?!) who have a LAN solution, for the LAN, MIDI, serial and even apperently the cart port. I sent them mail and just got back some pricing info. For a two node LAN (cable, and software) just a tad over $200. Not unreasonable, IMHO, but I can't afford it just yet...

Get the Spectre GCR dongle used. I got one for $75 and it works stunningly well with older Mac OS's (no System 7.X support) and software. I just got it working and was blown away by the speed compared to a real Mac. We have an SE-30 and a LC-II Mac at work and my humble Spectre cart does screen re-draws faster than either of them!! I even have Multi-finder working, and can multi-task MS-Word, MS-Excel and Superpaint - all at once on only 4 meg!

Of course I run in mono and use Warp 9 which makes a huge difference (grin).

Message-ID: <42qo5t$5r3@nic.wat.hookup.net>
Source record: 159427

I recently obtained a demo copy of the spreadsheet program SHEET30 written by Chor-ming Lung of Boston. I was impressed with the ability to include basic program statements in a spreadsheet...a lot more powerfull than the limited Macro language in other Lotus-like programs I have tried. Unfortunately, when I tried to contact Mr. Lung to see about getting an un-inhibited registered version my letter came back "address unknown". Does anyone know his whereabouts, or e-mail address?

I would be interested in hearing from anyone who has used the full version of this program.

While I am at it, I am still seeking the author of the program Silhouette, or someone who would sell me a working copy of the program.

It there a Pagestream user-group out there? There used to be a Pagestream newsletter publiushed from Vancouver Island, but they moved to the US. Does anyone know there current whereabouts, status, e-mail address?????

Thanks to any and all assistance. Cheers, RickJ.

To run Spectre you need _both_ the Spectre disk and a working version of the Mac OS prior to version 7.X. Run the Spectre software and before you hit return, put the floppy with the Mac OS in the A or B drive. When the Mac disk with the question mark appears, hit F1 for drive A, F2 for drive B.

This will (hopefully) load the Mac OS from floppy. If you can get that far, email me and I'll tell you how to set it up for hard drive (grin). It's _very_ improtant to _not_ remove a floppy 'til you see the flashing A or B on the upper right of your screen - if you do so, you can frag your floppies!

I am using HSMODEM 4 on my TT with a Hayes Accura 288 attached to Serial
2 getting a DTE speed of 115200 baud.
If you want, I can post the settings I have used to achieve this.

It was none other than egg@yolk.demon.co.uk who did write on 07 Sep 95 that
... e> Does anyone know where I can get the hd driver software or
e> something similar for partitioning my hard disk for my Atari
e> Falcon? Apparently, the software that comes with Cubase audio only
e> allows you to do small partitions less than 240 meg.

HdDriver is sold by Systems Solutions in the UK .

V4 will be ready in a few weeks I beleive .

What's the problem with Calamus? MagiC 3 hasn't been released in UK yet, but magic 2 works fine with the lastest version of calamus. In earlier version a fix exists for the text problems and windows. Note though that even the latest version seems to have probs with the text editor locking up unless you run Calamus in single mode.

Simon

The problem is that I had to removed the both serial ports for my Crazy Dots
graphic card.
Connect runs with max 1800 cps (depending of the quality of the telephone
connection). Unfortunately Oasis 1.30, the program I most use, runs when I
have luck with a max of 1500 cps.

Thanks Martin

Don't know about ESDI, but the e.g. Megafile30 is a MFM drive. And in the
German c't magazine there was once a project called 'Billigloesung' (cheap
soulution) by which one could connect an MFM disc to an ST.

Oopps, my last posting must of got lost in the ether-waves :)

ftp micros.hensa.ac.uk

cd micros/atari/falcon

files a052 - Colour MPEG, used by 1st guide
a047 - Mono MPEG, by Griff - faster both are falcon ony and use the DSP

In the tos area file q086 is a quicktime MOV player - hanv't tried it yet as I
havn't got any MOV files unless anyone knows how the read the MAC bit of PCW
CD-ROM?

Version 0.95 of AVI-Play works with windows video files - i couldn't get 0.94 to
work... I think this just uses the 68L

Does anyone know any players that also decode the audio stream?

hope this helps ...

s> HSMODEM6 patch on my TT. With this alone I can't go further than
s> 19200. Do I need hardware to accelerate the modem 1 port or are I just
s> doing something wrong with the HSMODEM6 patch?

You don't say what machine but it must be pre-Falcon or you wouldn't have this problem. With a 28K8 modem you DEFINITELY need to speed up your modem port to use its full potential. The h/w mod. is easy - yu will need a 4040 chip and a small switch (if you want to be able to revert the modem port to 19200). This mod. gives you a DTE speed of 38400.

The trickiest tasks are deciding where to mount the switch so as not to snag the shielding and cutting one leg of a chip on the PCB. But don't let this put you off. The job takes 1 hour tops.

Carry on using HSMODEM.

MFM, yes, provided you can get the right adaptor board (Adaptec 4040, I think). This gives you MFM->SCSI so you still need the usual SCSI->DMA adapter board as well.

Best forget it - the MFM is likely to be past its best by now anyway.

>
>I am thinking of just putting the old controller chip back in the machine
>and dealing with it. This is a bummer, tho...

You're getting into deep trouble fiddling with the jumpers on the drive.
I did so a couple of years back and got so stressed and discouraged that
I gave it a rest. I did manage to get *one* brand of drives working after
some weeks(!) trying, and have never used any other brand since.
The trouble you're experiencing lies herein (I had the *exact* same
effects as you describe above) : When the drive has a HD floppy inserted
The drive and the computer both need to know that and act accordingly.
With the jumpers you can do this, but most jumpers seem to influence the
settings of the others. I mean, it is possible that even if all but one
jumper is in the right place, the drive still doesn't do anything...
I had a drive with 10+ jumpers. Still have nightmares about it ;-)
It gets more complicated in that TOS 2 and above have a weird way of
dealing with floppies and that PC-drives sometimes use other pins for
the output/input of the HD-signal.
See next list of possibilities...

pin 2 acts as output, Switch also used for drive.
pin 34 acts as output, Switch also used for drive.
pin 2 acts as output, Switch not used for drive.
pin 34 acts as output, Switch not used for drive.
switch used for drive, computer figures out thru software what type of disk.
switch not used, computer figures out thru software what type of disk and
a) inputs it at pin 34 or

b) inputs it at pin 2

Of the possibilities above only 3 *theoretically* could work.
In *some* system, that is, not specifically in atari's therefore.
Furthermore, if you add to this the trouble with seekrates, drive-ID's,
bad or inadequate floppycontrollerchips (not in your case as you use an AJAX)
trouble with not-recognised diskchanges under some circumstances, etc...
I reckon you will want to stay away from it.
If not, feel free to contact me, but expect no miracles.

>:
>: What is the drive model number?
>
>The original drive, which I have a feeling may be bad, is a Teac FD-235HF.

This one is a very good drive but a pain in the *ss to configure.
I never got it right...

>The drive I am trying to work with is Mitsumi D359T3.

Don't know this one.

>] sold commercially...
>
>Doesn't Calamus do the same thing? Uses the hard-disk as extended memory?

Yes, but not quite as sophisticated. Calamus seems to swap entire *files*
to harddisk, not just parts of ram. Example: If I have 2 Megabytes free
RAM in Calamus and 140 MB free virtual RAM I still cannot load in a .TIFF
file of more than 2 MB (a lot smaller actually, due to overhead)
If however I use 200 pages in my Calamus document with a 300 KB .TIFF on
each and every page, no problem. It swaps the pages I currently do not
use to Harddisk, but the one page I have on screen *must* fit in RAM
completely icluding all associated files like pictures et al.

On the other hand,
If I try to load a 130 MB .TIFF in Cranach Studio, no problem with that.
Well, it will take maybe half an hour loading :-),
but still... it works.

Try the SHIFT key which is located at each end of the 2nd row from the bottom
or to save you holding it down, the best computers are even equipped with a key
labelled CAPS LOCK which is to the right of the space bar.

Hi all!

I have problem with Mega STE keyboard. CONTROL key doesn't seems to work anymore. I opened it and find out that problem lies in membrane - it needs to be replaced with new one. Membrane was manufactured by Mitsumi.

So if someone know where to find a new one... drop me a message!

Loris

Sorry to those of you who have read this before but I haven't had a single response so I figure I'll give it one more try:

I am looking for a cartridge port combiner (for stfm) so that I can plug two dongles in at the same time. Can anyone point me in the right direction please. I know cubase don't make them anymore but surely there must be one somewhere.

Thanks again

Neil

Yes... there is one with TOS 4.92... It installs a bootsector on a floppy, which loads in the TOS (reset resistent) and then reboots the machine. It only boots of floppy (with 4.92 anyway...)

: What are the pro/cons compared to a terminal emulation connection,
: how do you set it up, what is needed of software/hardware...?
: I'm grateful for any information.

PPP = point to point protocol
SLIP = not sure :) I think it's Serial Line interface Protocol or
something similar.

These are ways of implementing tcp/ip over serial lines on computers so
you can network them together.

Since tcp/ip was developed primarily for the internet if you get a
ppp/slip connection with a computer connected to the internet then it's
possible to become a site on the internet too.

I.e. you have your own ip address, etc...

The upside of it is that your computer is actually *on* the 'net so you
can run Web Browsers, Ftp clients, Gopher, etc. and have the resulting
files downloaded straight to your computer instead of going through a 3rd
party host.

The downside is that unless you have a leased line or some other
permanent connection that your computer is only temporarily on the
internet, so telnetting to it to collect mail is impossible. There are
ways around this using POP3 which is a mailbox format you can collect by
telnetting to a specific port and it downloads it.

Also because tcp/ip was developed for ethernet systems, the code isn't
optimised for speed and so ppp/slip connections are inefficient compared
to offline readers, sz and the like...

The main ways to go are NOS and MintNET. Depending on what sort of
connection you're looking they vary in how easy they are to set up.

No other hardware's needed apart from a modem, enough memory to run them
and preferably a hard disk...

Paul.

Hi there,

I've been lurking around for a while now. The more I read these messages,
the more questions I have.
I'm thinking to speed up my modem port. For the moment I use the HSMODEM6
patch on my TT. With this alone I can't go further than 19200. Do I need
hardware to accelerate the modem 1 port or are I just doing something
wrong with the HSMODEM6 patch?
I haven't the slightest idee how the different drivers are configurated.
I've used them just like they are when I've downloaded HSMODEM6. I do have
a 28800 modem and I want to use them at 28800. Certainly now I've received my
telephonebill. It was quite a lot I can tell you that. :-((

3668. Simple FTP/Telnet/Lynx/Mail solution for all TOS Machines*

Newsgroup: comp.sys.atari.st
Date: 1995-09-09 00:00:00 UTC
From: sxp17@po.CWRU.Edu
Message-ID: <42rcbc$49p@usenet.INS.CWRU.Edu>
Source record: 159438

*Caveat - must have access to Internet-linked Unix account!

I've been doing this for a while, and it just occured that it may not be so
obvious to all other users.

1) Get an internet-linked Unix account somewhere (easily thru your University)
2) Dial in with ANY terminal program and login to your account
3) From here, you have your choice of ftp, telnet, and mail commands!
In the case of retrieving FTP files, just use "sz [filename]" to send
your binary files to your hard drive. Stalker is superb for this.
4) Lynx is also available through the University Freenet, in my case.

Limitations and etc.
~~~~~~~~~~~~~~~~~~~

1) Can't do graphical WWW (what were you thinking?!!)

2) Must have some knowledge of basic Unix commands (get;lcd;bin;etc)
The commands needed to FTP can be learned in 5 minutes (5 or so commands)

3) You essentially download your files twice (once on the Unix machine -
at app. 86 kbytes/sec for me, and once to your TOS machine - at a measly 3
kbytes/sec on my 14.4 connected at 38.4).

4) You must convince your University Unix account administrator that you
NEED an account. (Give him/her the old orphaned/retro platform plea
and that you have no money to upgrade.)

Advantages
~~~~~~~~~~

1) No messy set up on your hard drive; No alternative operating systems.

2) No SLIP/PPP line or setup required.

3) No pages of configurations and read-me's.

4) Even a 520ST with a 2400 baud modem can do this!

5) All processes on both ends (Unix/TOS) will be able to use time tested
and efficient software. Fast and clean transfers result.

6) Free (at Universities for students, anyway)

~~~~~~

Hope this helps at least ONE person! Please feel free to add/attack . . .
~~~~~~
